Problem

In some unattended modes of operation, it is desirable to have HOST start up without any operator prompt for either enabling or disabling the remote <BREAK> key. Below are some optional patches for TRSDOS 2.0a which, when applied, will allow the HOST function to start-up without either displaying the question "Disable remote <BREAK> key (Y/N)" or requiring the operator's reply.

When the first patch is applied, the remote <BREAK> key is automatically enabled at start up; if the second patch is applied instead, HOST starts with the remote <BREAK> key disabled.

Solution

To Enable the remote <BREAK> key:

```
PATCH SYSTEM64 R=25 B=22 F=21D9F50E C=06001818 (for 64K HOST)
PATCH SYSTEM32 R=25 B=22 F=21D9750E C=06001818 (for 32K HOST)
```

To Disable the remote <BREAK> key:

```
PATCH SYSTEM64 R=25 B=22 F=21D9F50E C=06011818 (for 64K HOST)
PATCH SYSTEM32 R=25 B=22 F=21D9750E C=06011818 (for 32K HOST)
```
