NOLAN BUSHNELL: Of Pong & Pizza
DOCTOR VIDEO
ACTIVISION'S SOFTWARE WAR

**“EITHER THIS
SPACE GAME
OR MY LIFE
GOING 1**

IS THEIR BEST ME EVER, NG ROOM IS 65 MPH?"

Aliens up ahead. Aliens attacking from the rear. Alien ships on every side. Meanwhile, the earth is moving steadily into range of enemy missiles, as the alien planet rushes by below.

Presenting Star Strike™. The exciting new space game complete with brilliant colors, gripping tension, and special effects so realistic they appear three-dimensional. So you almost feel like you're flying.

Be careful, though, and don't lose your concentration. You've got to destroy the enemy planet. Before it destroys the earth.

Play Intellivision® Star Strike. Then, when the battle's over and the dust is clear, compare it to other space games. We think you'll agree that color, excitement and special effects make Star Strike the clear winner.

- OUTTAKES** 82

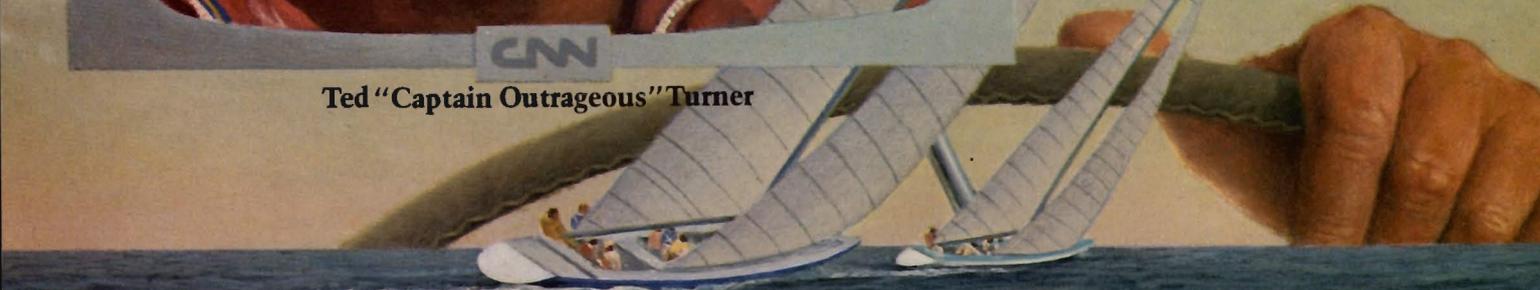

HERE'S TO GUT FEELINGS AND THOSE WHO STILL FOLLOW THEM.

Ted Turner does lots of things people advise him not to do. And he succeeds at them. He turned Atlanta's WTBS-TV into a "Superstation" using a communications satellite and recently founded Cable News Network, the world's first 24-hour TV news network. He bought the Atlanta Braves and moved them out of last place; won the 1977 America's Cup after being fired in the '74 races; and was named "Yachtsman of the Year" four times.

Ted Turner puts his feelings where his mouth is. He also puts a great scotch there: Cutty Sark. And while he's been called Captain Outrageous by some, one thing's sure: Ted Turner's enjoying himself.

Ted "Captain Outrageous" Turner

The Scotch with a

following of leaders.

 PIONEER

IT IS PHYSICALLY IMPOSSIBLE FOR YOUR TV TO BE AS EXCITING AS OUR TV.

Watching Pioneer 50" Projection TV is very different from watching TV. In fact, the experience is much closer to being at the movies. The sheer size of picture and sound involves you like your television never could. Heroes are no longer pigmies. Panoramas begin to look panoramic.

The difference in watching sports is nothing less than astounding. After watching football on TV for years, it's like seeing it for the first time. And hockey, well, finally you can see the puck.

But Pioneer Projection TV gives you more than a big picture and sound. It gives you a great picture and sound. With the Pioneer LS-501, the problems of early big-screen TV are finally over.

The LS-501 offers the brightest picture ever seen on a projection TV. A picture so bright you no longer need a darkened room. And a picture so sharp you can see it from any angle in the room.

Attach our Projection TV to your Pioneer LaserDisc™ player, and it's also the most exciting way to watch LaserDisc. (It even has built-in stereo speakers.) Or hook up your VTR to it. Or hook up your video games to it. Everything takes on a new dimension.

Call us at 800-621-5199* for the Pioneer Video Showcase Dealer nearest you. He'll sit you down in front of it. And suddenly everything will be abundantly clear.

The Best in Sight.

HYPERSPACE

Video games aren't a fad. What do you think about that?

I think it's true and I'll tell you why.

Video games earned more than all of pro baseball, basketball and football last year, ran neck and neck with records and films and even collected more cash than every one of Las Vegas' casinos. Dollars, however, don't always make sense.

Video games is a new form of entertainment and that's why all of its competitors are shuddering; they'd like to believe that it will go away but have that terrible suspicion that in one form or another these delightfully hedonistic playthings will be with us for quite awhile.

Space Invaders was a fad and so is Pac-Man. If you follow my drift, then so was "Bette Davis Eyes" or any of the countless Number One singles that have passed in and out of our lives forever. Add to that list popular films like *Star Wars* and *Raiders of the Lost Ark* (which, by the way, are being converted to video games)—fads for sure. The art and craft of making films, records or video games is one in the same. Only the by-product becomes a fad.

Enter **Video Games** magazine, stage-right. I think it's safe to say that as of yet, no print media has adequately narrowed in on the needs and interests of the rapidly-growing video game-playing public. There are reviews to be read, issues to be dealt with and behind-the-scenes personalities to be introduced—not to mention ten years of games history to be chronicled. We plan to do all of this *and more* in an intelligent, incisive manner.

In this, our premiere issue, we have assembled a most competent cast to carry out this task. We began by asking artist Stanislaw Fernandes to render Pac-Man—the industry's hands-down "Man of the Year"—for our cover. Not only did Stanislaw come through with a gold brick-gobbling munchkid, but added his unique touch to two other articles (see "Play Ball!" and DR. VIDEO). Since Pac-Man is so much on our minds these days, we had illustrator Denis Orloff provide his interpretations of the yellow fellow (see BLIPS and "Last Word on Pac-Man") as well.

For our first "Video Games Interview," we wanted someone who could speak for and about the games industry both articulately and provocatively. Our choice was Nolan Bushnell, the man whom many refer to as the "father of video games." Since departing from Atari, which he founded, Bushnell has gone onto several new and fascinating ventures. I think you'll find his comments invigorating.

In this issue, we're proud to unveil five departments that we hope you'll make a habit of looking for. The BLIPS section should be taken absolutely literally—it's where you'll find specks of information that mean a lot more than they may appear on the surface. DR. VIDEO will concern itself with the pros and cons of video gaming, clinically-speaking. HARD SELL should be able to provide you with answers to your questions about which TV-games systems and computers to buy. COIN-OP SHOP is strictly for arcaders only and BOOK BEAT for those who'd like to know more about all those video books that will be making the bestseller lists in the months to come. Lastly, a column devoted to game reviews will begin appearing in our next issue.

Sounds serious. It should also be a lot of fun. Get involved. Send us letters. Fill out the Reader's Poll. And don't forget that the 16-page "Beating the Games" pull-out is just that—snap it out of the middle of the magazine and take it with you to the arcades. Good luck.

Q & A With Buckner & Garcia

Gary Garcia and Jerry Buckner are veteran studio musicians/record producers who recently combined their talents with their enthusiasm for video games and came up with a Top Ten single. "Pac-Man Fever," a Southern rock-styled ditty, as of this writing has sold more than one million copies and the album of the same name may soon surpass that figure. In the record business, there's only one word for such sales: Platinum! Natives of Dayton, Ohio, Buckner & Garcia (as they are musically referred to) received a call from Arnie Geller, the "G" in BGO Music based in Rome, Georgia (he also handles the Atlanta Rhythm Section) during the fall. If they just happened to be into the video sensation, Pac-Man, Geller had a proposition for them. They were and agreed to author the first of nine tunes based on the most popular video concoctions. This interview with Buckner & Garcia, conducted by Perry Greenberg, tells all about it.

Video Games: How long did it take you to write the Pac-Man single?

Buckner: A couple of hours.

VG: That's all?

Garcia: Hell, it only took us three weeks to write and

produce the entire album.

VG: You guys certainly work fast. Are you as proficient at playing the games you write about?

Garcia: At Pac-Man and Frogger I am.

VG: And you, Jerry?

Buckner: I'd have to say Centipede and Asteroids are my two favorite games. I'm also really good at them.

VG: Which of the two of you is the best gamer?

Garcia: I'd say we're both best at the games we prefer. Jerry blows me away at Asteroids.

Buckner: And I devour him at Pac-Man.

VG: Now that our readership is captivated, please explain how you got into video games in the first place and

also how the record came about.

Garcia: Well, we're both into pinball. We were in an arcade last spring and saw all the kids playing the videos instead, so we decided to give them a whirl. Before long we were hooked on Pac-Man. Naturally, we wondered whether the games could be converted into good songs. But, we never got the project off the ground until Arnie called and asked if we were familiar with Pac-Man. As it turned out, he was hooked, too.

VG: Why did Geller call you?

Garcia: We've been writing and producing tunes for BGO for awhile. The first was, "Merry Christmas in

the NFL," which as you probably know never hit real big. Then, we produced the "Theme for WKRP/Cincinnati," which was performed by Steve Carlisle. In addition to "Pac-Man Fever," we have an inspirational song that's presently number four on the country & gospel charts called "Footprints in the Sand." I'd say Arnie was well aware of our track record. Ugh—pardon the pun.

VG: I assume that you are fans of all the games you wrote about.

Buckner: Well, let's just say we were familiar with *most* of them. For a few, we went back to an arcade with gamers who showed us how to master them. I'd say we

Illustrated by Denis E. Orloff

BLIPS

did a little research, wouldn't you, Gary?

Garcia: Not to mention spend a few thousand quarters.

VG: So, has the phenome-

nal success of the album taken you by surprise?

Garcia: Not really. We've had other songs before that we thought could have been hits under the right circum-

stances. With the tremendous interest in video games, we knew that the album would get the promotional considerations necessary to make it a hit.

VG: Are you ostensibly saying that the primary reason for the record's success is the popularity of the games, not the merits of the songs?

Buckner: Not at all. The one thing we tried to do is make good songs, regardless of the games' sounds. If "Pac-Man Fever" wasn't about Pac-Man and didn't have the appropriate sound effects, we still feel it would've been a hit.

Garcia: We've always written what we consider good songs, but it did take a record with a very popular theme to make the people in the music business finally take notice of us.

VG: Are you, however, worried about being stereotyped in the business as "those guys who wrote the Pac-Man song"?

Garcia: To be honest, we do worry about that—about being considered a novelty. But, if you remember, the Beatles were considered a novelty, and so were the Stones. We feel the music business is really a way of communicating with people and touching a responsive chord in their lives. When you've sold a million albums it proves you've done just that—so who cares what they label you?

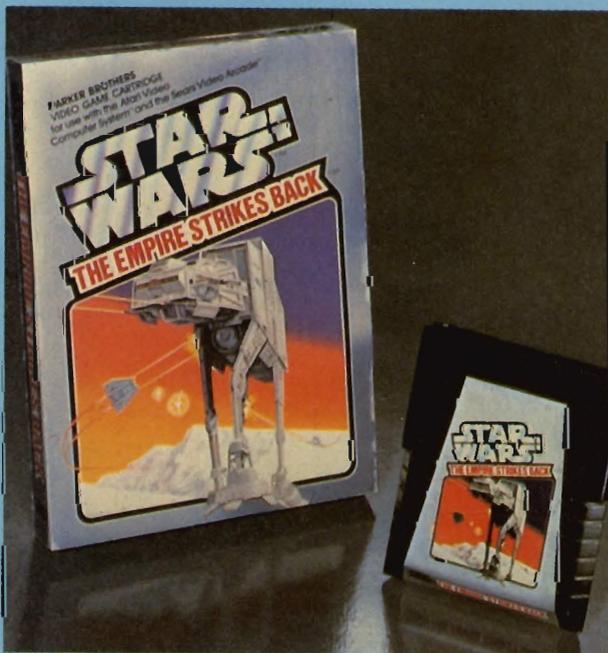

VG: The next single off the album is "Do the Donkey Kong." Is it your personal choice?

Buckner: We weren't given the liberty of suggesting what song would be released as the next single, but we are happy with the selection of "Donkey Kong." We feel there are at least three or four others songs that could also make it as singles.

Be the First on Your Block

(Above left) Plug any of EGI's 16 games into this \$3,490 oak cabinet. Call 1-800-528-3350. (Right) Video Outpost is from the man who made New York's subway booths impenetrable. Call 516-288-5252.

From Parker Brothers comes "The Empire Strikes Back," the first of many film-to-game conversions. For play on the Atari VCS only.

Centuri's D-Day is licensed from Olympia, Inc. in Italy!

VG: Do you have any other news that you'd like to announce to our millions of readers?

Garcia: Sure do. First of all, a country & western version of "Pac-Man Fever" has been recorded by Edgel Groves. That should be climbing up the charts by the time your readers see this. And for our Japanese audience, we've changed the Pac-Man references to Puck-Man and released the single in English over there. I bet you didn't know that that's what they call Pac-Man in Japan. (Editor's note: Quite to the contrary. For the complete story of Pac-Man, turn to page 23—that is, of

course, after you complete digesting this fascinating interview.)

VG: Do you have any plans to take your show on the road?

Garcia: We're readying to do just that. In fact, the band is rehearsing for a European tour, which will follow the release of the album there.

Buckner: We'll be taking an assortment of video games with us and projecting the games' graphics onto a huge video screen in the arenas. We're going to be one big, rolling, music and arcade review.

VG: I'm sure it'll cost a couple of quarters to get in.

Who is This Man?

Behind those shades is a man who knows no fear. When he walks into an arcade, players shudder. We call him Coleco Clyde.

Just the Tax, Jack

Dwarfed only by El Salvador and unemployment, video games continue to find its way into the news pages with great regularity. As Gilda Radner infamously intoned on "Saturday Night Live" several years ago: "It's always something." If it's not a report of a town council voting to ban arcades within a 50-mile radius, then it's Assemblymen like Ed Sullivan and Peter Grannis, both New York City Democrats, proposing to a state legislature that video games should be taxed at a preposterous rate of 25 percent. That's six cents on every play. That could add up to quite a booty for New York State should the assemblymen have their way.

What prompted this notion? Sullivan, a gracious politician who returns his phone calls, explains:

"It is rumored that there is excess profits in the video games business. I spent an entire month trying to find out just how many games there are operating in the state and how much money is coming in. No one would open their books to me. So I wrote up a bill calling for a 25 percent tax. I don't want to put anybody out of business. I'd just like the operators to prove that they're not making as much money as everybody thinks they are. I'm a reasonable man. I just want to see the numbers. After looking at the books, who knows—I might up the tax to 30 or 50 percent."

Sullivan claims that video games, unlike other forms of entertainment such as baseball games and movies, remain untaxed. Operators do pay a sales tax whenever they purchase a machine, but

it is true that the quarters move cleanly from the coin box into the operators' pockets without a charge by the government. Sullivan says he is simply asking operators to "collect the tax, not pay it."

Bart Gullong, a Long Island operator who would be affected by this proposal, admits that Sullivan's logic is "flawless—there is a perception about this industry that it's all found-money, a sort of pot-of-gold view, but it's not true. Even a 10 percent tax would put me out of business." Gullong points out that for every extremely profitable machine he owns (such as **Pac-Man**), there are countless bombs. "Take **Make Trax**, for example. I paid \$3,000 for it five months ago and haven't made more than \$700 back on it. If I could sell it for \$800

today I'll be very happy. Now, the value of a **Pac-Man** is high, but remember I can't get all the **Pac-Man** I want. Believe me, this business is one big crap-shoot."

Meanwhile, Sullivan, who claims to be a fan of **Pac-Man** ("I never hit 20,000") and a foe of **Asteroids** ("I get blown away"), will attempt to bring the bill to the floor before the Legislature's session ends in June. "I don't oppose the games," he maintains. "I simply believe that we have here an instance of where money is being exchanged for service and not being taxed. Let's face it, with all the Federal cuts, the state could use that cash."

Accused of shaking down video games operators in order to balance the state's budget, Sullivan candidly replies, "Last year we shook down the banks—this year it's video games."

—Steve Bloom

Best Little Court Case in Texas

The most celebrated legal showdown in the coin-operated games industry's recent past must go on. That was the finding of the Supreme Court last February when a 7-2 majority decided to "remand for clarification" to Texas, (the Mesquite versus Alladin's Castle age-limit duel.

What duel? Briefly, nine years ago, Mesquite (a sub-

urb of Dallas) passed an ordinance banning minors unaccompanied by adults from playing video and pinball games. When, two years later, Mesquite relaxed that ruling at the request of the Bally-owned Alladin's arcade chain, then rescinded their license (the police chief had suddenly determined that Alladin's had "connections with criminal elements"), all

hell broke loose.

In legal round one, the District Court sided with Mesquite; round two saw the Fifth Circuit of Appeals reverse that decision. By fall of 1981, the principals argued at length before Burger's court. While it acted conclusively regarding the police chief's inquiry ("no constitutional objection to an ordinance that merely required an administrative official . . . 'to make such investigation as he deems appropriate' before formulating a recommendation"), the Court put off the more controversial age question.

Wrote Justice Stevens: "Because learned members of the Texas bar sit on the Court of Appeals for the Fifth Circuit, and because that court confronts questions of Texas law in the regular course of its judicial business, that court is in a better position than we to recognize any special nuances of state law." He then concluded: "If Texas law provides independent support for the Court of Appeals' judgment, there is no need for decision of the federal issue . . . the case is remanded for further proceedings consistent with this opinion."

After months of waiting anxiously for the decision, each side reacted differently. "Obviously, we were pleased with the 'criminal elements' verdict," gloats Mesquite's attorney, Elland Archer. "The age-limit question may be of great concern nationwide, but to us Bally's operation here is more crucial. We

are determined to keep organized crime out of our city."

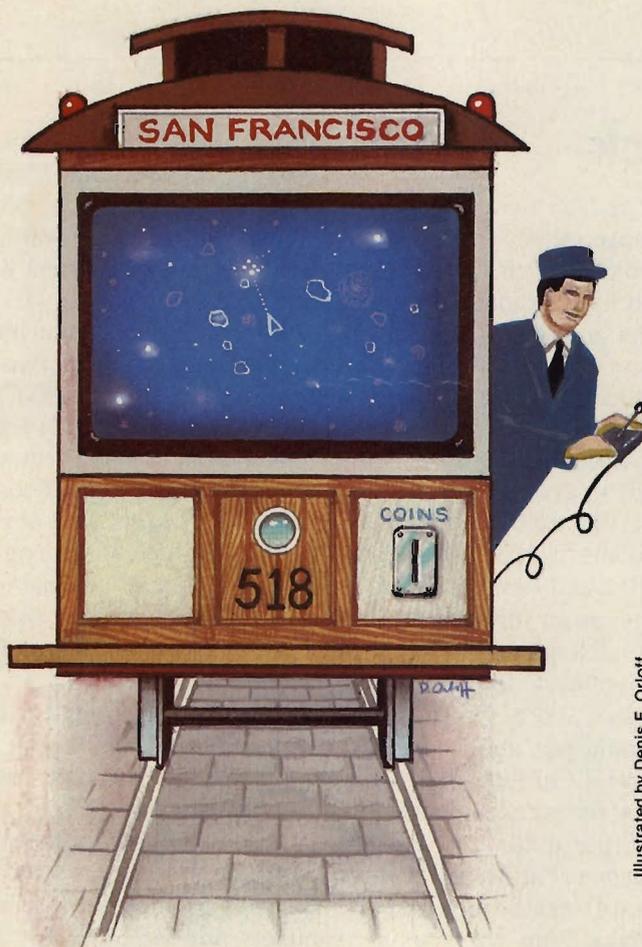

As to the non-decision, Archer believes that the Supreme Court was "uncertain about the Fifth Circuit's ruling that the ordinance was contrary to both the state and federal constitutions. They'd like to know whether the two constitutions are congruent."

David Maher, attorney for the Amusement & Device Manufacturers Association, which filed a friend-of-the-court brief on behalf of Alladin's, is not so kind. "Let's face it," he scowls. "The Supreme Court likes to duck difficult decisions. In this case, ambiguity was the key. The slightest ambiguity in the previous decision is enough to warrant a remand. Surprised? The Supreme Court never fails to surprise me."

Maher predicts that the case, now back in the Court of Appeals, could drag on for yet another year.

—Steve Bloom

SF to Atari: Thanks

Illustrated by Denis E. Orloff

Atari recently joined the campaign to "Save the Cable Cars" with a million-dollar donation. The committee still needs \$2.7 more. Call 415-956-3777.

Welcome to CES!

Speak software and carry a big joystick. This could very well be the slogan of the TV-games industry. At least it would seem that way judging by the staggering number of new hardware systems and game programs that will be unveiled at the Consumer Electronics Show from June 6-9 in Chicago.

Here are a few of the new items that will make their debuts:

 Address _____ Apt. _____
 City _____
 State _____ Zip _____

If under 18, parent must sign. _____

The Science Fiction Book Club offers complete hard-bound editions sometimes altered in size to fit special presses and save you even more. Members accepted in U.S.A. and Canada only. Offer slightly different in Canada.

How the Science Fiction Book Club works:

When your application for membership is accepted, you'll receive your 4 books for only \$1 (plus shipping and handling) and a free copy of *The Chronicles of Amber* and free carryall. If not completely satisfied, return the 4 books within 10 days—membership will be cancelled and you'll owe nothing. The FREE book and carryall will be yours to keep in any case.

About every 4 weeks (14 times a year), we'll send you the Club's bulletin, *Things to Come*, describing the 2 coming Selections and a variety of Alternate choices. In addition, up to 4 times a year you may receive offers of special Selections, always at low Club prices. If you want the 2 Selections, you need do nothing; they'll be shipped automatically. If you don't want a Selection, prefer an Alternate,

or no book at all, just fill out the convenient form always provided and return it by the date specified.

We allow you at least 10 days to decide. If you have less than 10 days and receive an unwanted Selection, you may return it at our expense.

As a member you need take only 4 Selections or Alternates during the coming year. You may resign any time thereafter or continue to enjoy Club benefits for as long as you wish. One of the 2 Selections each month is only \$3.98. Other Selections are higher, but always much less than hardcover publishers' editions—up to 65% off! A shipping and handling charge is added to all shipments. Send no money. But do mail the coupon today!

Note: Prices shown are publishers' edition prices.

BLIPS

a programmable TV-games unit. Priced at only \$129.95, its most remarkable feature is a 12-volt adaptor which allows hardened gamers to take the 2001 with them. At presstime, titles of the 20 cartridges were not yet revealed.

•Coleco's own programmable, ColecoVision, which was first shown at the Toy Fair last February, and at least 13 carts (including Donkey Kong, Turbo and Mousetrap). Nine made-for-Atari VCS and 11 made-for-Intellivision carts as well.

•Atari's 5200 Advanced Video Entertainment Sys-

tem (we'll be the first to dub it VES) and as many as 14 carts, including Star Raiders, Taito's Qix and a game version of the film, *Raiders of the Lost Ark*. Plus, seven new carts for the VCS, including *Raiders* and new versions of baseball, football and soccer. Ever since Atari won exclusive video games sponsorship for the '84 Olympics, they began designing an official Olympics Volleyball cart. It could be ready for viewing.

•Apollo's four new carts, Space Cavern, Lochjaw (*the Loch Ness monster meets a shark*), Raquetball and Lost

Luggage (gorillas go mad at the baggage claim).

•Activision's undisclosed new made-for-VCS carts. Expect one pair only. According to a company official, one will be an adventure game while the other is a fantasy that definitely is "not terrestrial."

•Imagic's crop includes four made-for-VCS and three for-Intellivision-only games. No titles yet.

•Parker Brothers' anxiously awaited *Empire Strikes Back* rendition, in which Imperial troops do battle with rebels on the Ice Planet, and Sega's arcade fa-

vorite, Frogger—both made-for-VCS carts.

•General Consumer Electronics' extravagant (\$200) tabletop unit, Vectrex. Supposedly, its vector monitor is able to duplicate 3-D simulations like those in the arcades. In addition to the built-in game, Mine Storm, Vectrex has 12 carts such as Star Hawk, Star Trek, Scramble and Berzerk. Although graphics are black-and-white, color overlays are available as an enhancement. For one player only. A second control panel can be purchased as an accessory for \$25. —Randi Hacker

Four Score and Seven Billion Points Ago . . .

For all you joystick wizards and master gamers out there who've been wondering if your scores stack up with the best, Walter Day, manager of the Twin Galaxy Arcades in Ottumwa, Iowa and Kirksville, Missouri, and a master gamesman in his own right, has been devoting

countless hours in an effort to establish the Twin Galaxies as the national headquarters for record video scores. Here are the top scores of 14 games tabulated at Day's Video Central. Except for Galaxian, all records were achieved this year.

BLIPS

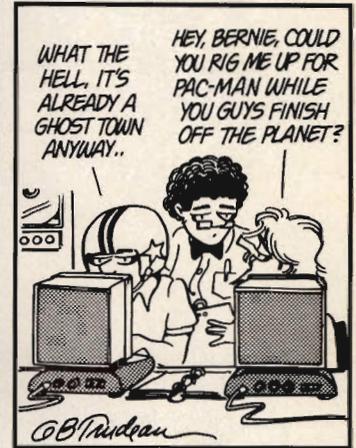

Video games are cartoons so it should not come as a great surprise that many of the country's comic strip artists have begun to try their hands at what is fast becoming one of our national pastimes. While Gary Trudeau ("Doonesbury") characteristically zeroes in on the military-industrial complex with his weeklong series of computer war-games, Jeff Miller and Bill Hands ("Tank McNamara") created a timely hockey video called "Great Gretzky" ("Try to skate

down the ice and shoot the puck into the net without being torn apart by the defense monsters") and also parodied a hearing over a proposed ban of video games. Finally, Cathy Guisewite ("Cathy") exposed what probably is her own habit with a number of Pac-related strips.

We have selected the best-of these artists video games works for those of you who might have missed them. *Video Games* will continue to do this in the future.

Nolan Bushnell

King Pong is now the head cheese at Pizza Time Theatre, a fast-food chain that serves up video games for dessert. His motto—"When I see a concept that makes sense I have to put it into action."

Nolan Bushnell, 39, is the most legendary figure in the brief—but frenzied—history of video games. In 1971, while still working as a \$12,000-a-year research engineer for the Ampex Corporation, Bushnell and a partner—Joe Keenan—each contributed \$500 to start a video games company. One year later, that infant operation (then named Syzygy), which had begun as a lab in Bushnell's daughter's bedroom, became Atari, Inc. Atari ultimately developed and marketed 35 types of video games before selling the company to Warner Communications for \$32 million—Bushnell's take was just under half of that—in 1976.

That same year, while still with Atari, Bushnell designed a family entertainment center for San Jose's Town and Country Village. His idea was to combine a quality pizza restaurant with a video arcade and have a trademarked Cyberamics system of three-dimensional, computer-controlled characters with names like Chuck E. Cheese, Jasper T. Jowls and Harmony Howlette, entertain the diners. That first small unit, opened in 1977, served as a prototype for Pizza Time Theatre, Inc., Bushnell's current major business interest. Pizza Time has more than 60 centers now in operation.

VIDEO GAMES recently interviewed Bushnell at Pizza Time headquarters in Sunnyvale, California. His

office is small, but somewhat opulent by Silicon Valley standards (old-line CEOs like Charlie Sporck of National Semiconductor and Robert Noyce of Intel don't have private offices—only partitioned spaces). The dominant features of the room are a larger-than-life papier mache carnival figure, a beer cooler disguised as an antique cabinet and large, burgundy-colored distinctly Edwardian English leather club chairs. A photo of Bushnell's attractive wife and young son sits atop a bookcase where copies of books by Albert Camus and Mark Twain rest alongside tomes with titles like *Pulse*, *Switching & Digital Wave Forms*.

Bushnell, himself, cuts an Edwardian figure; tall, bearded, a slight paunch that suggests that the antique beer cooler is still functioning. He is a friendly, candid man with a self-confident manner that many people mistake for ego. On this particular day, he's sporting a blue blazer and grey slacks, an Armani tie and loafers. This is as close to getting dressed up as anyone comes in Silicon Valley. Bushnell radiates a lot of energy and through-

out the interview moved from one chair to another all the while fiddling with his pipe.

VIDEO GAMES asked Jerry Bowles, a freelance writer whose most recent book *A THOUSAND SUNDAYS - The Story of the Ed Sullivan Show* was published by Putnam's, to take time out from his busy schedule during a recent visit to California and interview Bushnell. Their conversation went something like this.

* * *

VIDEO GAMES: You're aware, no doubt, that some of your contemporaries have taken to calling you the "godfather of video games." It's an apt conceit and makes an interesting point about the similarities between the high technology and film industries. The players are essentially the same: risk-takers, creative types, venture capitalists, and so on. In some ways, your career parallels that of George Lucas. If Atari was your "Star Wars," then Pizza Time is "The Empire Strikes Back."

BUSHNELL: That's a good point. The similarities are certainly there. There's a lot of money and glamour in both industries. I must confess, however, that my Hollywood hero was Walt Disney. He was one of the great American entrepreneurs. A little boy once asked him if he drew Mickey Mouse. He said he didn't. The boy asked him if he directed the studio's movies. Again he

"Pac-Man Fever." The one and only album for a video-crazed America.

"Pac-Man Fever," the single inspired by the most popular video game in America is a huge hit! Its driving rhythms have inspired even championship players to new heights!

Now, the "Pac-Man Fever" album is here! Like the single, the other songs on the album were inspired by the nationwide video game craze. Each song is devoted to a specific game and contains sound effects from that game. Whether you're obsessed with *Frogger*, *Centipede*, *Asteroids*, *Donkey Kong*, *Defender*, *Mousetrap* or *Berzerk*, there's something on here for you!

And there's a bonus that's bound to improve your score—a special inner sleeve which shows five winning Pac-Man patterns!

So get "Pac-Man Fever," the album, now! If you don't your competition will eat you alive!

"People have an ingrained notion about leisure—essentially, anything that's fun is somehow not holy."

had to confess that he didn't. "Well, what do you do," the boy asked. Disney replied, "I'm sort of like a honeybee. I fly from flower to flower and pollinate them." That describes what I do.

VG: That raises another interesting point. The press always credits you with being the creator of Pong, Atari's original video game. But, as I understand it, you didn't actually write the program.

BUSHNELL: That's true. The software for Pong was written by an engineer named Al Alcorn. Pong was really a mistake. The game I was really going for was a driving game, but I had just hired Al and didn't feel he was quite up to that speed. I asked him to do a sort of simple Ping-Pong kind of game as a practice exercise, a throwaway, really. It turned out to be a heck of a lot of fun, so we decided to market it on the way to the driving game.

VG: Then, you are admitting there is some question about the authorship of the game?

BUSHNELL: Well, it's one of those funny things. Al and I talk about it all the time. He did the software, but I designed the game. I sat down and said the ball should act this way and the sound should sound like that—that sort of thing. He executed it. Alcorn steadfastly maintains that he designed it and I maintain that I did. I always tell him I get the credit because I have more access to the press than he does.

VG: Let's go back in time a little. When and where did you first become interested in video games?

BUSHNELL: There were a couple of factors involved. My interest really began in the early 1960s when I was studying electrical engineering at the University of Utah. They have a good computer science department there headed by Dr. David Evans, one of the pioneers in the field of computer graphics. Anyway, I used to go over to the department at night and play an old game called Space Wars, which had been written on the first computers at M.I.T. It was a good game, although a little advanced for its time.

Every summer while I was in college I worked as manager of the games de-

partment of an amusement park in Salt Lake. I was struck by how old-fashioned most of those attractions were. I mean, knocking milk bottles over with a baseball is not the most contemporary game in the world. I got to thinking one day that there would be a tremendous market for a computer game like Space Wars. But it just didn't make economic sense at the time. It would have taken a heck of a lot of quarters to pay for an \$8 million computer. So I just filed the idea in the back of my mind.

VG: When did you—as they say in computer parlance—retrieve it?

BUSHNELL: Around 1969 or 1970. I was working for Ampex in Redwood City as a research engineer by then. Microcomputers had just begun to hit the market and I could see my idea becoming more viable. Originally, I envisioned linking a number of video screens to one central computer. But as I kept adding more and more elements,

one day it just hit me: I can do this whole thing in hardware. Once I figured that out, though, the economics seemed overwhelming.

VG: What was your first game?

BUSHNELL: It was called Computer Space. Actually, it was a refinement of Space Wars. It was a good game, but a little ahead of its time. We only sold about 2,000 units, but that was enough to get us off the ground. We also operated a 100-unit route at night. With our technical skills, we were able to put back together old junker games that we had picked up dirt cheap. It provided cash flow.

VG: What kind of corporate structure did you have at the time?

BUSHNELL: Complicated. I had started a company called Syzygy and through that sold Computer Space to a local firm, Nutting Associates. Then, I went to work at Nutting to put the unit into production and to refine it. Syzygy

World's Largest Selection of Commercial and Home Video Games.

We stock Ms. Pacman™, Donkey Kong™, Centipede™, Stargate™, Zaxxon™ and all the other great commercial video games.

We also stock Atari®, Intellivision™ and Odyssey 2™ units, cartridges & accessories... plus T-shirts, cases, game watches, etc.

This year — Coleco™, IMagic™, US Games™, Activision™, CommaVid™, Parker Brothers, Apollo™ and Computer Magic™ will produce Intellivision™ and Atari® Cartridges and we will stock them all! Be the first to receive each new cartridge.

"Al Alcorn steadfastly maintains that he designed Pong. I always tell him that I get the credit because I have more access to the press."

Bushnell and longtime partner Joe Keenan (left). Admits Bushnell about Keenan's former company, "It was a kind of subterfuge."

was just a partnership, but when we tried to incorporate we found that the name was already taken. That's when we changed the name of the corporation to Atari.

VG: And why Atari might I ask?

BUSHNELL: In the Japanese game of Go, Atari is a polite warning to your opponent that he's about to be engulfed. It's something like check in chess. I just thought that that was a neat name for a corporation.

Anyway, Nutting never really understood the relationship that was required for me to stay with them. After Computer Space was in production they said "OK, Nolan, you're head of engineering—how about designing another game for us?" And I said, "OK, let's figure out how much of Nutting Associates I get." I saw it as a situation where I was helping them get into a new busi-

ness, but they said they were Nutting Associates, big and strong, really smart guys. It was obvious to me very early on that they were not smart guys in terms of business strategy. Anyway, I said, "What I want is an option on a third of the company and more say in the marketing strategy." They basically said, "No, Nolan, you're a good engineer. We'll give you five percent of the company on an option if you stay in engineering. We'll take care of the marketing." And I said, "Nyet!" Two days later, I resigned and set up Atari.

VG: With \$500, as the story goes.

BUSHNELL: Well, actually it was a situation where Syzygy was set up for \$500. I had negotiated a royalty rate from Nutting for Computer Space, so, in reality, Atari was founded on royalties from Computer Space.

VG: Then, there was a company called

Kee Games, Inc. which merged with Atari in 1974. Who were they and how did they fit into the picture?

BUSHNELL: Kee was a marketing ploy. You probably know that Joe Keenan and I have been close friends and partners in business since the very beginning. Joe was president of Kee and ran the company. The reason we set Kee up is because each city had two major distributors and each one demanded an exclusive contract. That left the other guy, who was usually almost as strong, without a source of video games. These guys were running around like crazy trying to get manufacturers to supply them with games so they could compete with the guy down the street. We knew we had a technological lock, but we didn't have the marketing lock. So we formed Kee Games and operated it as a separate company even though it was primarily owned by Atari. It was a kind of subterfuge, if you will. Whenever Atari would come out with a game, lo and behold, Kee would produce an equivalent or a modified version. That way we were able to keep other manufacturers out of the market, at least for awhile. It was a distribution game. Strategy! Gameplay! Joe left Atari in '79 to join me here. He's the president and CEO of Pizza Time.

VG: Let's talk about your latest collaboration with Keenan—the Pizza Time Theatre. When and how did that idea get started?

BUSHNELL: I first came up with the idea around 1974. We were moving toward its realization when I sold Atari to Warner Communications in '76. Warners went ahead and opened one center; but they were clearly not very interested, so Joe and I bought the concept back from them for \$500,000 in June, '77. The following year we raised some more venture capital and incorporated.

VG: I've understood that you hated the way video games were being presented. Was this a factor in your decision to start Pizza Time?

BUSHNELL: Definitely. I felt there were a lot of people who would like to

From Steve Bloom's 'Video Invaders'

THE ABSOLUTELY, POSITIVELY LAST WORD ON PAC-MAN

*The acknowledged King of the Arcades
now has a wife, a hit record
and more spin-offs than 'Dallas'
and 'All in the Family' combined.*

*I've got a pocket full of quarters and
I'm headin' to the arcade,
I don't have a lot of money
but I'm bringin' everything I made,
I've got a callous on my finger and
my shoulder's hurtin' too,
I'm gonna eat 'em all up
just as soon as they turn blue.
Now I've got 'em on the run and
I'm lookin' for the high score,
So it's once around the block and
I slide back out the side door,
I'm really cookin' now,
eatin' everything in sight,
All my money's gone,
so I'll be back tomorrow night.*

— "Pac-Man Fever" by
Buckner & Garcia (©1981)

The scene: a Brooklyn shopping district, outside a delicatessen. The time: after school. A Pac-Man machine is chained to the store's security gate and two teenaged girls on roller skates have the game all to themselves. They are sharing a can of Pepsi, a bag of Pretzel Nuggets and, best of all, Pac-Man.

Lisa is by far the better player of the two. While Lisa claims to have scored over 100,000 points yesterday, Maureen is struggling in the low 20s. Lisa doesn't kid around. Ever so nonchalantly, she completes maze after maze and talks to me at the same time.

"I play all the time," Lisa explains as she shakes two ghosts and swallows a power dot. "This, Space Invaders, Galaxian, and Phoenix are my favorites. The trick to Pac-Man is the pattern. Just watch. That's how I learned. Everyone cheats off of everyone else."

Maureen, meanwhile, stands by impassively, waiting her turn. She has nothing to say.

"Oh, I hope I get to the bells," Lisa says greedily. The bell is one of the many bonus targets only star players like Lisa get to go for in later rounds. Finally, she is cornered by the so-called "ghost monsters" and her turn is over. With one Pac-Man remaining and a reading of 65,000, Lisa just may break her record.

As Maureen takes over the joystick (four-way lever control), I pepper Lisa

with more questions. She acknowledges spending her allowance on the games; when I ask her if her parents mind at all, Lisa whines like the 14-year-old she is.

"It's my allowance," she insists, adding for good measure, "I bought these skates with my allowance, too." So there.

"Do they care?" I press on.

"Nah, they don't care."

Maureen is having problems. When her last Pac-Man gets bitten she bangs the glass, screaming that the game is messed up.

"How come it's OK for me?" Lisa sneers. But she's about to get hers, too. A minute later Lisa's skates nearly slip out from under her and the final Pac-Man is eliminated. So much for her record-breaking attempt. Next quarter.

* * *

Pac-Man is like a good old-fashioned B movie. It starts out with titles, credits, and a musical theme that sounds vaguely similar to the old standard "A Night in Tunisia." Instead of anonymous aliens dropping from the sky,

"Video Invaders" is an Arco Publishing book.

Photo session courtesy of Vintage Car Store, Inc., Nyack, New York. Model: 1982 Excavator Series IV Phantom.

Pac for Sale

Pac-Man may mean many things to many people, but to fledgling businesses like Wiz Kids, Video Babies and Amusement Marketing Concepts, it's a good, quick buck. All are involved in the merchandising of video game-related products from frisbees to license plates (see photo). But, according to David Rabiner of Video

Babies, the going is getting tough.

"We got in before it got hot," he says. "We got some good licenses (including Pac-ties and "I Break for Pac-Man" bumper stickers). "Now the big boys are moving in. I understand Uniprints advanced Midway \$100,000 for the t-shirt deal. That's about \$95,000 more than we can afford."

—S.B.

though, we meet Inky, Blinky, Pinky, Clyde, the four dauntless "ghost monsters" whose shifty eyes you must constantly watch. Needless to say, they are the bad guys. Pac-Man, the hero of our story, is a frisky yellow disk with a pie-cut for a mouth, who aims to run these pesky varmints out of town. And run is exactly what these five vid kids do—all around a blue maze.

Pac-Man, like one of the gunslingers of old, out-numbered by merciless outlaws, is saddled with an enormous task: He must avoid this colorful gang of four while swallowing up the 240 white dots that cover the paths of the maze. Each dot gobbled is worth ten points and is accompanied by a rapid succession of chortling noises. As long as the Pac-Man can keep his distance from the bug-eyed boys, he seems to be having a helluva time. But one false move and he's gone—literally—the Pac-Man folds up and disappears. If he manages to eat all 240, he gets a fresh supply and a new start.

There is more, of course. The power capsules stationed in each corner are

the gateways to higher scores; use them wisely and you can add 3,000 extra points with a few well-timed gulps. When Pac-Man gobbles a capsule, the gang suddenly turns blue and dashes away. They can be feasted upon now, but Pac-Man's advantage only lasts a moment. The ghosts soon return to their menacing form and the chase resumes. The third and final source of points is the bonus target, which switches identity (from cherries to keys) and increases in value the farther you get along.

Each time you clean out a maze you get an identical new one, but the ghosts pick up the pace. The prize for completing the mazes, aside from extreme gratification and an ever-increasing point total, are some brief intermissions, during which the cast puts on a little show. In the first, a giant Pac-Man terrorizes one of his rivals in a madcap romp about the mazeless stage; in the later breaks, he visits further humiliations on the villain. Though there's no time for popcorn, these respites come in handy —

in fact, you'll need them. Like every great video game, Pac-Man grows more difficult with each screen, challenging you not only to outwit it, but to physically keep up with it. With its simple joystick, though, how could anyone resist?

Pac-Man fever, it's driving me crazy, Pac-Man fever, I'm going out of my mind.

—Buckner & Garcia

It starts with the wait, with the quarters lined up on the ledge of the machine. Before long, it's T-shirts, pop singles, news of the latest ailment resulting from compulsive play of a particular game, reports of profits that would feed all of West Africa. And if the story isn't "I Was a Space Invaders' Zombie," then it's "I Was a Teenage Pac-Maniac." But where Space Invaders was a global phenomenon, Pac-Man has become America's game. With 100,000 units on the streets, it has surpassed Space Invaders and Asteroids, the previous Crown Princes of

Video, to become the acknowledged King of the Arcades (and inspiration of countless imitations).

That Pac-Man is a Japanese creation may seem ironic, but, in reality, it is the least unusual part of this story. While breaking ground in both maze design and its novel use of cartoon-type characters, it is probably best recognized as the game that dragged women out of the video closet and into the arcades. Traditionally, men have had the arcades largely to themselves. But Namco's Pac-Man changed all that. Though it clearly was not intended that way (as we will see), Pac-Man is even now being hailed by some as the first "women's" video game.

Atari's Donna Taylor is one of the very few non-male game designers in the field. Asked for her opinion of Pac-Man, she says, "I admire it a lot. I think it's proved that you don't have to be lost in space to have a good time."

To Taylor, easy controls are the real key to Pac-Man's success. "I won't play buttons. I just don't think it's worth the trouble. I know plenty of other women who feel that way, too." She cites Defender, with its five buttons and joystick, as the "worst" offender and credits much of the acceptance of her own game, Centipede (which utilizes the Trak Ball and a fire button) to its "minimum of controls."

"Another problem," insists Frank Ballouz, Atari's Vice-President of Marketing, "has always been where the games are located. You won't see a lady hanging around most arcades or 7-11s to play. But now that you find the games in lounges, airports, and restaurants, women are being exposed to the product more often." And now that manufacturers have awakened to the fact that women will play, they aren't going to ignore them again.

The stories of some women's compulsive attachment to Pac-Man have already made the rounds. Take the case of a Florida beauty salon owner who installed the \$2,500 machine on the premises, or the more farcical tale of a wife who threatened to leave her husband unless he could prove to her that Atari had not already released its Pac-Man cartridge (which it hadn't at the time). According to an Atari spokesperson, one phone call from the company to this slightly hysterical woman

was enough to patch up the matter — and the marriage.

Don't think the industry isn't ready to capitalize on their new-found friends. But where Centipede and Frogger were arguably designed with women in mind, Midway's stunning follow-up to Pac-Man — titled Ms. Pac-Man — leaves no room for argument.

Made up with a bow and ruby-coated lips, the Pac-Man has swung the other way, so to speak. Plus, the maze has been redecorated. Just take a look: Ms. Pac-Man has painted the maze pink, moved the fruits and other bonuses around at random, and opened up two more escape tunnels — it was getting pretty stuffy in there, wouldn't you agree? But this is all luke-warm-to-medium camp compared to

*"Like every
great video game,
Pac-Man challenges
you not only
to outwit it,
but keep up
with it. With

how could
anyone resist?"*

the intermissions. Act One (following the second screen) flashes back to that eventful day when Pac-Man and Woman met; Act Two follows their courtship and subsequent nuptials; in Act Three, a stork appears, delivering none other than Pac-Baby. No joke!

* * *

Pac-Man wasn't designed for women. Over in Japan, where the game was invented, women had always played all the games — from space battles to car chases — as fanatically and skillfully as the men. By 1980, the question facing Japan's games community was not how to attract women, but how to rekindle flagging player interest in general. Space games, which had won Japan its honorable reputation in the business, had suddenly bottomed out. To Atari's sur-

prise, Asteroids — the hit of the year here — bombed out miserably over there. "I could never understand why it was a good game," contends Yoko Yama, a representative for Data East. "I think as a people, we did not understand it. It was very difficult for us to play." Again, the controls were causing complications. "We found the buttons hard to operate," he says. "The U.S. likes buttons. We are much happier with levers. I don't know why that is. Maybe it has something to do with typewriters." (They're not nearly as common in Japan as they are here.) In any case, space was out. And what was in? Comedy.

According to Yama, the Japanese have a "comical sense," and are great fans of comic books, sitcoms, and cartoons. Taito-America's president Jack Mittel tries to explain: "They [the Japanese] want more of a story line, more of a Walter Mitty experience that's like a whole movie. They are very cutesy." Yama believes that the Pac-Man characters are a composite of those that appear and have appeared in Japanese comic strips and books, but can't pinpoint which ones. He is positive, however, that several of Pac-Man's successors (such as his company's Lock'n'Chase and Treasure Island) are direct representations of Japan's most popular cartoons and strips.

No company had less experience than Namco Limited for developing a comical game. Though Galaxian — which was essentially a new, improved Space Invaders — had established Namco as a force in the video arena, simulated batting and skeet-shooting devices were really their forte. Namco's Hideyuki Nokajima describes Pac-Man's genesis:

"People were fed up with space games. So we started to dream up games that would make them laugh. For instance, in Japan, *puck* is the sound you make when you eat something good — like *munch*. We decided to build up a game around that idea instead of shooting. *Puck, puck, puck* instead of *blam, blam, blam*. Everyone was skeptical about Pac-Man because it was the first video game with so much strategy but no fighting, but the more people in the company tried the game, the more they became ad-

dicted. We discovered that the energy dot touched people's inferiority complexes. People like to feel like Superman. This all swayed the negative votes. Nevertheless, there were many who felt Pac-Man would never gain acceptance abroad. They thought it was too typically Japanese. Obviously, that was unfounded."

Namco contacted Midway, who had licensed Galaxian from them, in early 1980. They had a game called "Puck-Man" that they thought Midway might be interested in. The story goes that Bally's new president Robert Mullane was so unimpressed by what he saw that he advised Midway against buying it. "It's silly," Mullane jeered. "Anyway, who plays a maze game?" Fortunately for Bally, shrewder minds prevailed and Midway went ahead with the agreement. But first, there was this little matter concerning the work "puck" which had to be cleared up. "They didn't like how it rhymed with your very popular expletive," Nakajima smiles, "so we changed it to Pac."

Pac or puck, the annual gathering at the Amusements and Music Operators Association in November didn't quite get the joke. For them, space was still very much "in" and "anyway, who plays a maze game?" Since only two (Targ and Duel) of the year's Top Twenty videos (as determined by Play Meter magazine) were mazes, you could say they had a point.

"People thought that the cute-factor was going to nail us," recalls Midway's marketing director, Stan Jarocki. "But, we had been through this kind of thing before. If you remember, Space Invaders also got the old ho-hum at the 1978 A.M.O.A. From then on we just decided, 'Don't tell me it's bad until the players see the game.'"

Can you honestly say you know someone who has not played Pac-Man? Pinstriped execs steal precious hours from their business lunches to get at a machine. Housewives have been spotted jockeying Pac-Man with one hand and rocking babies with the other. Needless to say, kids have been more than zealous with their support. One bunch I recently ran into doesn't even bother with arcades anymore. Each has his own Apple computer, on which he is learning to program; but,

come Saturday, the bedroom converts into a gameroom. The afternoon I joined them, Gobbler and Snoggle, two floppy-disk replicas of Pac-Man, were without question the most requested games of the day.

Can't afford an Apple? Don't despair. There are always the TV systems and their corresponding cartridges: for instance, with Atari's Video Computer System you can play Pac-Man (again, licensed through Namco) at home. Magnavox has K.C. Munchkin available for their Odyssey 2 (Editor's note: The 7th Circuit Court in Chicago recently enjoined Magnavox from manufacturing this cartridge. The judge, petitioned by Atari, concluded that K.C. Munchkin is a copy of Pac-Man. Magnavox, who has already lost a bid in the Court of Ap-

Bally's Mullane
jeered. 'Anyway, who
plays a maze game?'
Fortunately for
Bally, shrewder
minds prevailed."*

peals, is appealing to the Supreme Court.), while Munchie can be plugged into Astrovision's Bally Arcade. Wait, there's more! For really cheap thrills, both Coleco and Tomy have battery-operated, miniaturized Pacsimiles (couldn't resist) and under yet another assumed name is VTech's Crazy Pucker by way of Hong Kong.

It should be no surprise to anyone that maze games have begun to inundate the lucrative coin-games business. Just about every major manufacturer has gotten into the act. At the '81 A.M.O.A., we saw Exidy's Mouse Trap (mice, cats, and dogs), Williams' Make Trax (goldfish, birds, and a paintbrush), Stern's Turtles (giant turtles and turtles), Taito-America's Lock'n'Chase (cops'n'robbers), Centuri's Round Up (so-called "gly-boys"

and cowboys), and Nichibutsu's Frisky Tom (mice, a blonde, and a plumber named Tom). As it was, the show's two most exciting variations on the maze theme, Nintendo's Donkey Kong (a damsel, an ape, and a carpenter named Mario) and Sega's Frogger (frogs and logs), both dare players to scale from the bottom of the screen to the top; this really makes the games more like obstacle courses than mazes, since you always know where you're going—up.

Only Atari seemed to make it policy not to take part in this spectacle. Explains their chief coin-op engineer, Lyle Rains: "We had the first maze game with Got'cha (1974) and we've looked at other maze games, but essentially our policy is to produce games that are different from everyone else's. Unfortunately, everything at the A.M.O.A., except for Tempest and Qix, looked like something else. That's very typical in our industry." (To the contrary, at presstime Atari had just announced the release of a maze game named Dig Dug. Created by Namco, it is Atari's first license of a coin-operated game, breaking a decade-long, steadfast in-house R & D policy.)

"There's a trickle-down effect that happens," says Tim Skelly, an independent game designer. "Everyone begins to realize what works and what doesn't. That's why you have so many imitations." Skelly, who is responsible for Cinematronics' Star Castle and Rip-Off, among others, rips the Japanese for being "horrible copiers," but adds, "Most of their games don't cut it here anyway. I foresee them losing a lot of business in the States."

While many of the American companies continue to look toward Japan for licensing deals, there does seem to be a slight turn away from that trend. Even Midway, who owes their fortune (approximately \$200 million on Pac-Man sales alone) to Japanese ingenuity, is beginning to bank on its own research and development staff for promising new game ideas. Then there is Taito-America, whose parent company, Taito Corporation, invented Space Invaders: With Qix they have not only one of the strongest games of the '82 season, but an entirely American-made product as well. Says Mittel proudly: "The Japanese had nothing to

THEY'VE GOT THEIR ACT-IVISION TOGETHER (AND ARE TAKING IT TO THE BANK)

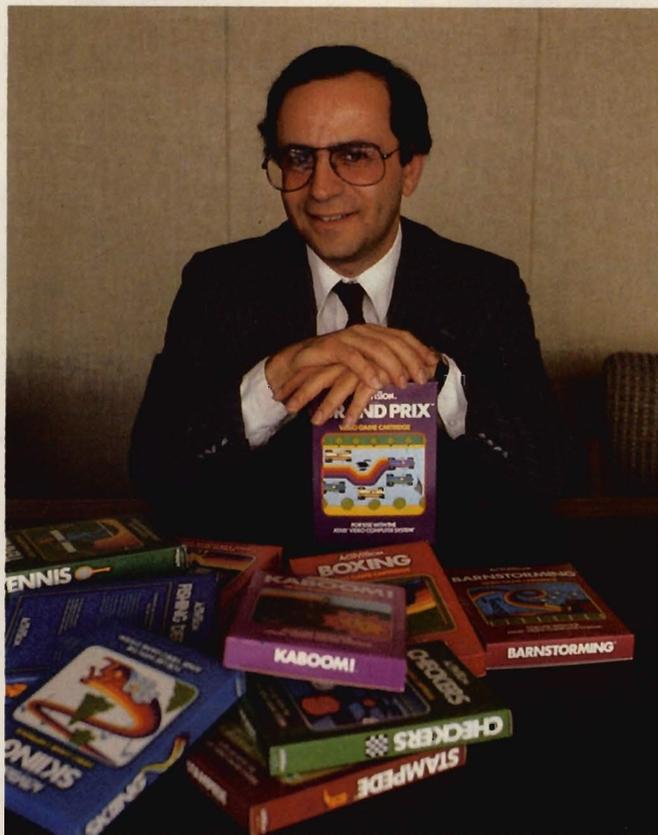

By Randi Hacker

Doctors aren't the only ones who have discovered the benefits of specialization. In the video game industry, there are the general practitioners who manufacture both hardware and software and then there are those who mainly concentrate on creating new cartridges. They're software specialists, so to speak.

The leading specialist in the business is Activision. Formed in 1979 by four renegade game designers from Atari and a record company executive, the company was the first to recognize the vast market potential for a software-only manufacturer. Since Atari owns the largest market share for TV-game systems, it was logical for Activision to develop its initial programs to play on Atari's Video Computer System (VCS).

Activision has very methodically made its presence known, releasing two cartridges each quarter since 1980. Its game library has been hailed by critics as the most diverse and creative in the burgeoning software arena. Considering the technical limitations of the five-year-old VCS, Activision's accomplishments thus far are doubly remarkable.

Unlike many of its rivals, this Santa Clara firm has a distinct aversion to translations of popular arcade games. Despite the trend in this direction, Activision owns no licenses and has no plans to acquire any. All of its games

JIM LEVY AT THE HELM: "I think we electrified the industry."

such as Fishing Derby, Laser Blast, Freeway, Skiing and Kaboom! are totally original concepts.

Judging by Activision's growth, it would seem that this policy is sound. Over the past three years, the company has gone from \$6 million to over \$60 million in sales and increased its number of employees from 22 to almost 100. During this past March alone, they shipped over one million cartridges.

"The lesson in all of this," says VP Tom Lopez, "is that original, creative material is the very best marketing policy."

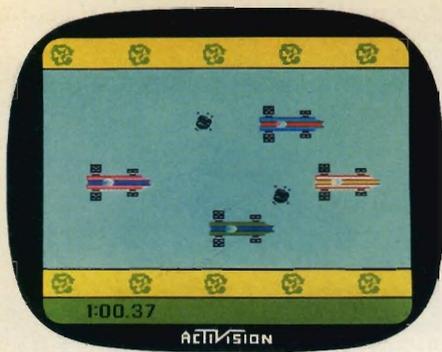

Activision got its start in the video game industry almost by accident. In 1979, GRT, a Sunnyvale-based record and tape company, was in financial difficulty. Jim Levy, a former GRT executive with an entrepreneurial flair, was putting together some capital to buy a division of GRT that he felt could become successful in what was then a very difficult time for the music industry.

While making these plans, Levy received a call from an attorney friend who had been talking to four Atari designers (Al Miller, Dave Crane, Bob Whitehead and Larry Kaplan), who had a wild idea about wanting to leave the company and start up one of their own, devoted solely to designing and producing game cartridges.

Their problem was that none had the business experience necessary to run a company. They also needed money. Levy's curiosity got the better of him and he agreed to meet with the group that would soon be respectfully referred to as the "Gang of Four."

Levy knew that the four designers were among the very best at their trade, and he knew the how to sell. With his managerial ability and their creativity, Levy could see a winning combination. Everyone concerned was excited about the possibilities.

Levy returned to his backers and presented a new proposal. He believed that

the home computer software industry was about to explode like the record business had in the '50s. This explosion, he explained, could produce giants in the home video game cartridge business much like those in the record business. The hardware was already in place, he told them. Now, all that was needed were more good-looking, creative game designs for use on the existing systems. Since none of the systems on the market were compatible (they still aren't) they decided to go with the categorical hardware leader, Atari. At least, the Gang of Four would know what they were getting into.

With their investor's blessings and almost a million dollars in startup money, Levy, Crane, Whitehead, Miller and Kaplan founded Activision. Now in their third year of operation, Activision is looking forward to sales of \$150 million by next spring.

Boasts Levy, "I think we electrified the industry. We came out of nowhere and took a generational step forward in terms of game design. People point to Intellivision because of the pretty pictures it puts up, but I would stack up most of our cartridges against any of theirs for realism."

"A lot of our games come out nice graphically," adds Lopez. "but it's the playability that keeps people coming back for more. We don't want our games to end up on a shelf."

Probably more than anything else, Dave Crane's games are responsible for Activision's eclectic reputation. His own problem negotiating rush-hour traffic on Chicago's Lake Shore Drive evolved into Freeway, in which a fearless chicken must cross a road to get to the other side. A rather pretty, harmless design for a video aquarium of sorts became a Fishing Derby, a two-man competition that principally involved the evasion of a fish-eating shark. His latest

project, Grand Prix didn't even start out as a driving game.

"I began with nothing more than a pretty car," he explains. "I went through a lot trying to figure out how to make that car into a driving game. It really comes down to this—there are a limited number of game concepts so

you have to fit your ideas into a category. Grand Prix is actually more of a memorization game than it is a driving game. You have to learn what cars are going to be coming when, so you know how to avoid them. The trick is you have to do it perfectly or else the course will be different every time."

Bob Whitehead, the author of such cartridges as Boxing and Stampede, maintains that certain games are easier to design than others. "Sports games, like Boxing, are nice to do. They're well-defined. I don't have to worry about parameters or inventing something entirely new. I like them because I tend to be lazy. Stampede and Chopper Command were a different story. There was no definition with both, I had to start from scratch by figuring

NOT JUST ANOTHER PRETTY PHOTOGRAPH: Activision's assorted software and merchandising paraphernalia laid out. (Above) Crane's Grand Prix and Whitehead's Stampede. Wondered Whitehead, "Wouldn't it be great to have a cowboy game?"

Photo by Victoria Rouse

THE GANG OF FIVE: Whitehead, Cartwright, Kaplan, Crane and Miller. Says Crane, "Who knows what a spaceship looks like anyway?"

out how to play and what the graphics should look like."

How *Stampede*, Activision's first country-and-western video game, came about is indicative of how the design process works. "My parents live in a small farming community," Whitehead explains. "The big annual event there is a stampede. At one point, I thought to myself, 'Wouldn't it be great to have some sort of cowboy game?' I decided that yeah it would be great and got to work on it immediately. For awhile I

was waking up in the middle of the night saying 'Hey, this might work!' But then the next morning it wouldn't. The actual design for the game didn't hit me until two or three weeks later. Sometimes games come together all at once in your mind, but other times you have to throw the whole idea out and start all over again."

Like most creative professions, designing video games is both a labor of love and a lot of hard work. First, there's the initial three, four or even as

many as six weeks that are devoted to outlining the basic game concept. Then, the designer works with the lab technicians to put together a prototype model.

"At this point, we take pot shots at changing this and that," says Whitehead. "I say I want the cow (in *Stampede*) to be over there. Someone says it would run a little faster. There are all these small changes that have to be made. This part of the process can take

(Continued on page 80)

Like, Imagic

If you haven't already guessed, there's a software war going on. Since Activision dropped the first bomb, a number of other software-only companies have started up, armed with fresh supplies of video ammo. Bill Grubb's Imagic should become Activision's stiffest competitor.

Grubb, the former president of Atari's consumer entertainment division, has assembled an uncanny mix of ex-Atari and Mattel employees. Dennis Koble, a software manager at Atari and Brian Doherty and James Goldberger, respectively senior project engineer and marketing manager executive at Mattel, form Imagic's braintrust. A host of designers has also been lured out of both camps.

"There are a limited number of top-notch designers in the country," Gold-

berger points out, "and we feel we have our share of them. That's the key. Designing games is like an art. You can do all the research in the world, but unless you have a flair for it you won't end up with a good picture."

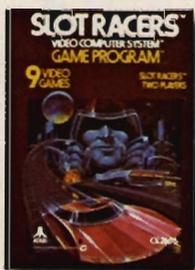

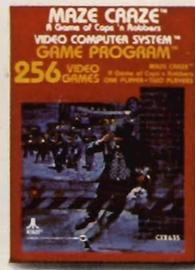

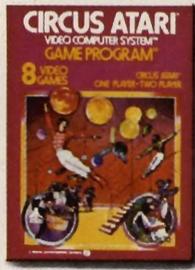

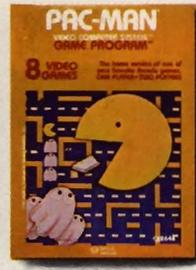

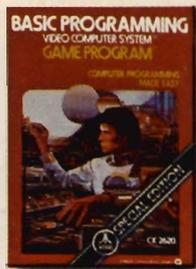

Imagic's debut at last January's Consumer Electronic Show in Las Vegas drew rave notices. Each of their three cartridges on display—*Star Voyager*, a first-person space game; *Demon Attack*, a remarkable translation of the dive-bombing aliens arcade theme; and the billiard simulation, *Trick Shot*—featured high-resolution graphics and challenging gameplay. All can only be plugged into Atari's VCS.

While Imagic established itself before the trade troops at CES, it didn't exactly separate the chaff from the wheat. This

time around, however, at the June CES showcase, will be a different story. Imagic plans to release seven cartridges—four for play on the VCS, three to slip into Mattel's Intellivision. That, my friends, is a first. Goldberger explains:

"We believe its time to start taking advantage of Intellivision. If we feel we have a great concept, we'll design it with Intellivision in mind instead of the VCS. As you know, because of the different hardware capabilities, some games could be excellent for Intellivision, but not for the VCS. Some, though, will be available for both systems."

Regarding future game trends, Goldberger suspects a move into fantasy role-playing on the order of films such as *Excalibur*, *Dragonslayer* and *Clash of the Titans*. Better yet, how about a video version of O. Henry's short story, *The Gift of the Magi*?
—R.H.

TO

BE CONTINUED.

At ATARI®, we've not only developed the video games the world wants most, we've developed more and more of them.

And we plan to keep right on doing that.

After all, when you invest your time and money in a home video game, isn't it nice to know that the people who make the game are doing the same?

ATARI MAKES MORE HOME VIDEO GAMES THAN ANYONE.

HAVE YOU PLAYED ATARI® TODAY?

BEAT THEM AT THEIR OWN GAME!

The invasion of the little screen people is escalating. Not satisfied with their arcade conquest, Pac-Man, Donkey Kong, and their allies dare to menace the very living rooms of America.

To fight back, at home and at the arcade, turn to

Practical Advice From Isaac Asimov:

"A TRS-80 Color Computer Combines Out-of-This-World Fun With Down-to-Earth Practicality!"

— Isaac Asimov
Renowned Science and
Science Fiction Author

"Indulge Your Imagination With Radio Shack's \$399 Color Computer!"

"It's like having the cosmos at your fingertips!" That's what Isaac Asimov says about the incredible Radio Shack TRS-80® Color Computer. "I just plug in an instant-loading Program Pak™ for a rousing game of Space Assault," Asimov explains. "Then it's up to me to repel invading aliens."

"It's also a very serious hard-working computer." Radio Shack offers Program Paks for everything from personal finance to word processing. "And the electronic filing program lets me keep an insurance inventory of my personal possessions—in the event of invading *earthlings!*" Or program the Color Computer yourself in Color BASIC. "Color makes it fun to learn programming. And the excellent 308-page manual makes it easy."

"We have entered into the Computer Age." And Radio Shack makes the transition a smooth one. The Color Computer attaches to any TV set. And the Program Paks are remarkably inexpensive. When you are ready to expand into tomorrow, add up to four disk drives for greater storage.

See the remarkable TRS-80 Color Computer at your nearest Radio Shack store, dealer or Computer Center today.

I want a hard worker — that's a lot of fun! Send me your free TRS-80 Computer Catalog!

PLAY BALL!

Can't Tell the Computers Without a Scorecard

By Howard Coors

Buy a computer to play games. It may sound ridiculous but is it? As the price of home computers falls to below \$150 while the cost of sophisticated TV-games systems is climbing above this figure, consumers are presented with an interesting, but complicated choice. What is a video gamer to do? Well, he or she can either purchase a high-quality, graphically-appealing games console (ie, Mattel's Intellelevision), confident that stimulating new cartridges will continue to be made available, or opt to invest in a full-fledged computer (ie, Atari's 400 and 800 models), capable of playing scores of challenging games (or even designing new ones) and powerful enough to handle home and small business applications as well.

Since most gamers' knowledge of computers is cursory at best, this article will attempt to serve two purposes. First, it will answer the most fundamental questions about small computers' functions and capacities. Second, it will take you on a tour of the current crop of low-budget computers. Let's go!

What's the difference between a home computer and a personal computer?

Generally speaking, a personal computer is a small, powerful computer designed to be used in a business environment for budgeting, sales projections, payroll, marketing estimates and similar chores. Additionally,

these machines have become a popular plaything for sophisticated computer hobbyists. A home computer, on the other hand, is designed to handle less complex business chores, but can manage household budgets and even perform simple word processing. Its main strength and appeal (to arcaders, at least), though, lies in the outstanding color graphics available for game-playing. Despite advertising claims, a personal computer (plus its necessary peripherals, such as mass-memory devices and printers) will cost close to \$1,000: its home computer cousins come with a \$300-\$500 price tag.

What you need to know about hardware

You don't have to be an engineer to understand the basic workings of a computer. Your \$5 pocket calculator is actually the simplest type of computer. You enter information with a keyboard, the electronics inside do the numerical manipulations or computations, and the results are indicated on a display or paper printer. With a home computer, a typewriter-type keyboard is used to post instructions and data, a variety of semiconductor "chips" (aka, integrated circuits) act on the com-

mands and most often the home TV set is used to show the results.

Some keyboards, such as those supplied with the Atari 400 and Sinclair ZX-81, are touch-sensitive—meaning they don't operate or feel like conventional typewriter keyboards. They are usually a flat plastic sheet with a microswitch under each letter label. Users who can touch-type are usually slowed down by this, but non-typists have little objection. Most manufacturers, however, provide a conventional typewriter-style keyboard.

As is the case with TV-games systems, low-cost home computers are generally hooked up to the owner's black-and-white or color TV through an RF-modulator, a device connected to the TV antenna input that allows Channel 3 (or 4, depending on your location) to display the computer output. Unless you're prepared to pay \$400 for a 13-inch color monitor as an accessory you will probably have to get accustomed to using your own TV set.

The video screen formats for home computers vary considerably. Some can display a 22-character line (any combination of letters, numbers, punctuation marks or spaces) while others can handle up to an 80-character string. Also, where one computer can offer 16 lines on the screen another has room for as many as 24. It should be noted that for game-playing purposes, screen format is inconsequential. Word processing, though, requires a minimum of 64 characters per line and a 16 line display.

One last note about hardware: Games enthusiasts are certain to enjoy the computer's outstanding, high-resolution graphics. Unlike the unscintillating visuals that mar most games systems, both home and personal computers dazzle the eye. Lines are cleaner, figures are detailed, colors varied and intense. And what if you're not so inclined to tackle some alien army in a space duel? Punch up a program for a graph or a chart and watch the difference a reasonably intelligent machine can make.

What's a "K" and how many do I need?

"K" is a measure of computer memory and memory is the lifeblood of computers. The instructions or program for any particular routine, such

as income tax calculations, can be stored in a semiconductor "chip" called a ROM (or read-only memory). ROM is similar to instructions printed on a sheet of paper; it is permanently there for users to read from. In other words, a ROM chip can never be changed. Enter RAM (or random-access memory).

Since some calculations have to be temporarily saved or stored for later usage, there is a need for another type of memory. Where ROM coordinates the standard routines, RAM handles different numbers, data and calculations shuttling around inside the computer. If you will, RAM is like the "Magic Slate" kid's scratch pad—scribble notes and numerals, then simply raise the Mylar screen and, presto, your transmissions have disappeared... forever! With a computer, just clear the monitor and start anew.

Or turn the power off and you can accomplish the same thing. ROM will always remain the same; RAM, though, is another story entirely.

Now, about "K". A computer doesn't comprehend the letter "A" or number "1." It understands binary code or a sequence of bits. A bit is either an on or off signal; the best analogy is a light bulb, which can either be on or off—there is, simply, no in-between. A digital word for computers contains eight bits and it is called a byte. Various combination of bits are recognized by the machine as letters, numbers and punctuation marks—this enables it to communicate with us.

ROM and RAM is organized into memory cells. One "K" equals 1,024 bytes. So when a particular computer is said to offer 8K, this means it can store up to 8,000 bytes of memory (actually, 8,192 but let's not get too technical). Hence, an 8K memory can retain the equivalent of four typewritten pages, or about 8,000 letters. For home computers, that's adequate; for personal or business systems, though, from 32 to 64K is most desirable.

How do you store information (especially RAM)?

If you decide to write a program to keep track of your personal belongings or one for a new game you've dreamed up, you will need external storage to

save these instructions when the machine is turned off. A low-cost option (under \$80) is to connect a high-quality cassette tape recorder to the computer. You can then record your program or save whatever data you want. This choice is reliable, but time-consuming (you know, fast-forward and reverse)—it may take several minutes just to locate the information you want. One alternative to this—and a giant step forward—is to store the information on a magnetic slice of flexible plastic known as the floppy disk. The disk-drive mechanisms designed for this purpose not only retrieve information in less than a second, but can hold up to 184K. (Isn't jargon fun?) The cost, however, is considerable—from \$400 to over \$1,000.

For the record, floppy disks are available in two sizes: 5¼-inch and 8-inch diameters. The latter holds four times as much data as the former.

Is there any way to keep "hard copy?"

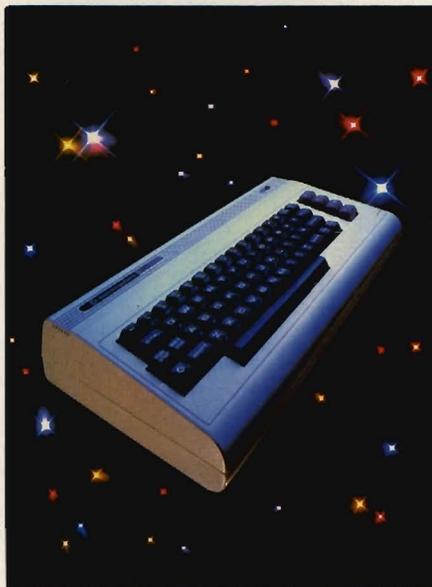

Once beginners are accustomed to using their computers, they invariably decide that it would be terribly convenient to have print-outs of their programs. Sure, they can punch a button and call up the information stored in the cassettes or disks up on the screen, but this means you have to stare at the screen and jot down whole paragraphs or charts. With a printer that hooks up to the computer (just like the cassette player), simply manipulate data, check the monitor and then press a button that activates the copier—again, like magic, a "hard copy" of the actual screen display emerges. File the sheet, take it to your office or accountant, make copies for distribution at meetings. Thanks to these wonderful machines, which start from as low as \$400 and climb to over \$2,000 for typewriter quality, computerniks *can* take it with them.

What's software?

Software's the part that's not hardware. Want to know anything more? Seriously, there's a lot more you should know. Software is what makes it possible for your computer to do all the things that the ads promise. A game is software. An income tax adviser program is software. To put it another way—the book/story *Shogun*

by James Clavell was software and the film/vidotape of the project was hardware.

Software comes in several varieties. The first is machine language software. This is the stuff that usually comes built in. It operates on the bit level and makes it possible for you to communicate with the computer using a higher-level (almost English) language like BASIC or LOGO or PASCAL. This software tells the machine where to find the memory, what to do next and when and all the other housekeeping details. You don't need to be any more concerned with this than you are with what flavor silicon they used for your chips.

Play arcade games like Gorf and Omega Race on Commodore's spacey VIC-20.

The software you're going to be dealing with are the programs that make the machine do what you want. Some of them you'll buy on tapes or floppy disks and, if you're ambitious, some you'll design yourself, using one of the higher-level languages that are easy enough to learn. Broken down to the simplest level, software is just instructions from you or another programmer telling the machine what needs to be done to complete a task, and when and how to do it.

* * *

Before I launch a review of the low-cost computers currently competing with one another, allow me to strongly emphasize that low-cost doesn't imply poor quality, inferior construction or

shoddy manufacturing. Quite the contrary. A marked drop in the price of chips and resourceful designs by manufacturers have enabled powerful computers that might, only a few years ago, have cost three to ten times as much emerge to find a comfortable place in the home.

Radio Shack's TRS-80 Color Computer (Price: \$399)

Though it was not the first to enter the personal/home computer sweepstakes, Radio Shack is credited with dramatically expanding the market. More than 300,000 of the first-generation TRS-80 Model I computers are presently scattered in both homes and workplaces. A follow-up to that machine, the TRS-80 Color Computer is more "affordable" (as it is advertised), yet equally as versatile. Not only does it challenge you at chess, checkers and backgammon or allow you to chase down foes in outer space, it actually encourages kids to sit down and improve their math, vocabulary and typing skills.

Before it is attached to your color TV, this computer will appear to be nothing more than a typewriter without a carriage. The one-piece unit comes complete with a keyboard, internal memory and an interface to slip cartridges into (joysticks must be purchased for an extra charge of \$25 a pair). A 53-key tactile keyboard provides the user with the feeling of keys actually being depressed; in addition, four function keys make program writing and editing an easy task.

For \$399, you receive the minimum RAM—4K; the memory capacity, though, can be upgraded to 16K for an additional \$99 or up to 32K for another \$149.

The video display can accommodate up to 32 characters per line and 16 lines on the screen, but letters are restricted to upper-case. For lower-case, letters are presented in upper-case format with foreground and background colors reversed. This is a serious disadvantage for anyone planning to purchase a home computer for the purpose of text manipulation. Offsetting this minor inconvenience are perfectly sound graphics. A tone generator is another feature. It provides the neces-

sary musical scores and effects for games. They include: Chess, checkers, pinball, football, backgammon, Space Assault, Polaris, Quasar Commander and the maddening Color Cube.

Not into games, you say? Take an educational break and learn about programming (*Getting Started with Color BASIC* is one of the more comprehensive training manuals in the field), brush up on your typing or even try your hand at composing computer music. Or really get serious and pop in an investment analysis cartridge to determine interest and loan payments, stock and bond yields and financial strategies—with a little luck, you may even pay off your initial investment in the Color Computer.

The Atari 400 and 800

(Prices: \$399 and \$899, respectively)

Experts long have hailed the 400 for being tops in games entertainment, which is hardly surprising since Atari boasts the lion's share of the TV-games market. Among this machine's most striking features is its ability to produce 256 different colors on a color TV at once and sound a wide variety of musical notes and cosmic explosions.

As for the hardware, the 400 employs a flat, touch-sensitive, 57-key keyboard and offers both upper and lower-case letters on its 40-character per line, 24-line display. This style of keyboard, disliked by many typists who prefer tactile reinforcement, has one interesting plus: the plastic sheet is impervious to soft drink or coffee spills. Included on the board are 29 graphics entry keys as well as a number of function keys. Still, it is certainly not the most intelligent choice for those who are interested in applications such as office routines or word processing.

The 16K RAM does not include the 400's programming language, which is BASIC. Spelled out, this means the owner must immediately invest in options in the form of separate units or packages. For gamers, the Entertainer package (\$90) includes controllers and either a Star Raiders, Missile Command or Chess cartridges; joysticks cost an additional \$20 a pair, cartridges go for \$30 each. For would-be programmers, a Programmer package

(\$90) comes complete with a BASIC language cart, self-teaching manual and reference text. An Educator package (\$200) includes a cassette recorder, the BASIC cart and an educational cassette; courses in French, Italian, German and Spanish as well as touch-typing and mortgage analysis are also for sale.

Hundreds of game carts can be purchased from numerous vendors. In addition, Atari provides their own Program Exchange (APX), which rates the software and even the programs' manuals, provided by an eclectic array of freelance programmers. As an example, the review of the game, Eastern Front, reads: "This is the best computer wargame we've ever seen. The graphic display is stunning. Because Eastern Front eliminates the drudgery of playing wargames, many people

*"Sinclair's ZX-81
is the lowest
of the low-balls.
As a matter of
fact, you can even build
it yourself for \$99.95."*

who've never cared for wargames before can enjoy this one. The game takes two or three hours to play and you can't save it, so be prepared for a marathon. The user manual is very good."

Among the peripherals available for the 400 is a cassette program recorder, a 5¼-inch floppy disk drive to expand memory to 92K and a printer.

The 400's big brother, the Atari 800, is quite capable of performing business and professional duties. The \$899 price tag, however, can quickly increase to thousands of dollars as peripherals are added. Although the low-end 800 only includes 8K of RAM, 8K of internal ROM and the 8K of BASIC in the ROM cartridge, additional memory expansion modules can be added up to 48K of RAM and 26K of ROM. For mass storage, up to 368K can be added through the use of four mini-floppy disk drives. Each drive can store up to 92K in a diskette.

The 800 includes a full-size type-

writer keyboard, a cassette recorder and game buttons on the front panel. For the convenience of 400 owners who decide to upgrade to the 800, all programs and games for the 400 can be run on the 800; similarly, all peripherals purchased for the 400 can be used on the 800 as well.

Commodore's VIC-20

(Price: \$299)

Commodore, with the lowest-priced full-size keyboard computer, is a veteran of the personal computer business, dating back to 1976 when it introduced the PET (Personal Electronic Translator). Initially, the PET which featured a black-and-white, nine-inch video display and cassette recorder was priced at the extraordinarily low cost of \$600; and that's when chips were considerably higher priced. The PET had one major drawback though—namely, the tiny, touch-sensitive, 73-key keyboard that used calculator-type push buttons. When this inconvenience was eliminated in favor of a full-sized keyboard, Commodore quickly became the third largest supplier of personal computers (behind Radio Shack and Apple) with over 150,000 units sold.

The VIC (Video Interface Computer)-20, which sells for \$100 less than its competitors, offers color graphics and sound capabilities intended especially for game enthusiasts and a keyboard that is considered highly preferable for business and word processing applications. The home computer includes an RF modulator, an AC power adapter and four plug inputs for peripherals like controllers, cassette recorder, printer and disk drive. The 65-key keyboard has upper and lower-case letters with 22 characters per line (not advisable for word processing) and 23 lines per screen. As many as three musical tones—tenor, alto, soprano—plus special effects can be generated and routed through the TV speakers. A slot located in the rear of the VIC permits up to four cartridges (RAM or ROM) to be connected at the same time. Among the game cartridges available are Draw Poker, and Superslot and two licensed arcade games, Omega Race and Gorf. (Commodore, incidentally, is the second home/personal company to negotiate such a deal with a

coin games manufacturer—Atari, beware!) For those more inclined towards business applications, there is the VIC Typewriter Word Processor, Home Inventory, and Personal Finance just to name a few.

When connected to a color TV, the VIC can display normal and reversed characters in eight colors. A 3K memory cartridge can be plugged in; if additional memory is required, 8K or 16K cartridges can be combined through the master control panel accessory that plugs into the cartridge slot to provide as much as 32K programmable memory.

Texas Instrument's 99/4A (Price: \$599)

In 1979, the world's largest manufacturer of semiconductors, Texas Instruments, jumped into the personal computers business with their \$1,150 99/4 model. Not only was the price steep, but the keyboard—it had only 40 keys—was flawed and the software limited. The public's response was negative and for good reason.

While commiserating back in the lab, TI's engineering braintrust redesigned the computer this time with the consumers' needs firmly in mind. The more reasonably priced 99/4A (many stores discount it for as low as \$400) features an improved typewriter-feel keyboard and enormous memory capability (16 RAM, 26K ROM and a plug-in opening for solid-state command modules with up to 30K ROM), far exceeding that of other home computers. The streamlined console packs a wallop with TI's 16-bit microprocessor, which is twice as powerful as the nearest competitor's. In addition, several other chips are used for screen display and generating sounds; in effect, this frees the central microprocessor to execute its complex tasks without the added burden of messenger audio and visual effects.

The 99/4A, if you haven't already guessed, is aimed squarely at the home market. Either connect it to your TV or purchase the ten-inch color monitor for another \$299. The display manages up to 32 characters per line (upper case letters show up as large caps, lowercase as small caps) and can handle as many as 24 lines of text. High-resolution, 16-color graphics offer sharp visuals

and three separate tone generators—each spanning five octaves—combine to form a stimulating environment for the bonafide gamer. Among the software available is several made-for-TI cartridges by Milton Bradley such as The Attack, A-Maze-Ing, and Hunt the Wumpus. Insofar as actual programming is concerned, the 99/4A speaks two languages—BASIC and LOGO, the computer dialect especially written for children.

Another advantage of this unit is the speech synthesis accessory. Brought to you by the makers of the innovative Speak and Spell teaching device, the 99/4A converses with you robot-style; this feature is of particular value for children who are too young to read what is displayed on the screen, but would like to play with the unit nevertheless. Again, TI shows that young-

“Software's the part that's not hardware. Seriously, software tells the machine what needs to be done and how to do it.”

sters' needs are a constant concern of theirs.

Other peripherals which plug into the 99/4A are a telephone coupler (modem) for communicating messages and data between computers via telephone lines, a cassette recorder, a disk system capable of holding up to three disk drives (each with 90K memory capacity) and a printer. Joysticks are also available.

Sinclair's ZX-81 (Price: \$150)

The lowest of the low-balls, the \$150 ZX-81 computer, is the brainchild of Clive Sinclair, a prolific British gadgeteer who's responsible for other such devices as one of the earliest pocket calculators, digital watches and a tiny, flat-screen TV. As a matter of fact, this bargain is even cheaper (\$99.95) if you have the wherewithal to build it yourself.

The ZX-81 may not serve as your small business computer, but don't write it off as a toy either. Only 6 x 6½ x 1½ inches in dimension and weighing in at twelve ounces, this shrimp of a computer could very well become the most popular at-home model in the years to come. Well aware of this development, software suppliers are stepping up their campaign to reach the ever-growing ZX-81 market. Presently, educational, personal finance, tax computation and games (by Softsync) cassettes have been made available.

Sinclair's original entry, the ZX-80, appeared on the scene in 1980 and found an audience of hobbyists and students attracted to the unit by its incredibly affordable price. The follow-up, the ZX-81, was redesigned using four integrated circuit chips instead of the 18 inside its precursor. Like each of the units discussed so far, this machine connects to a TV. Its features include a 24-line video display with up to 32 characters (caps only) and a small keyboard of the touch-sensitive variety, which means you'll never know whether you've hit the correct key without watching the screen at all times. Only 40 keys are provided.

Another drawback is the ZX-81's pint-sized memory capacity: 1K RAM and 8K ROM. Since 1K is hardly sufficient for even short programs, Sinclair does offer an optional 16K expansion module for \$100 that plugs into the back of the unit.

The ZX-81 isn't an Apple (see next section) by any stretch of the imagination; rather, it provides the absolute novice with an introduction to computers at—and I cannot overemphasize this point—a minimal price. Also, so portable is this machine that computer buffs have been cited connecting the tiny ZX-81 to their motel's TV set while on the road. Now, that's what you call mileage.

The Apple II (Price: \$1,300)

Despite the high price tag, I've decided to include the Apple II in this compendium. Next to Radio Shack's Color Computer, it's the hottest-selling personal/home computer in the country. Best known for the scores of games and various programs that have been designed for it, how could I possibly

The Theory of Heavolution

As man evolves, so do his reading habits

In his newest form, man is a class-act mammal. (Note the two-hatted, four-legged, eyes-bulging creature before you.) At his present state of intelligence, ordinary magazines are just not good enough for him. That's where we come in.

Heavy Metal, the world's foremost adult illustrated fantasy magazine, hits the spot. With 1,200 pages a year, the quality of beauty and imagination of *Heavy Metal* is unsurpassed by other publications.

So, order today. Who knows? In another 100,000 years or so, *Heavy Metal* could be obsolete!

HEY, BUDDY! CAN YOU SPARE A QUARTER?

©JOHN HOLMSTROM 1982

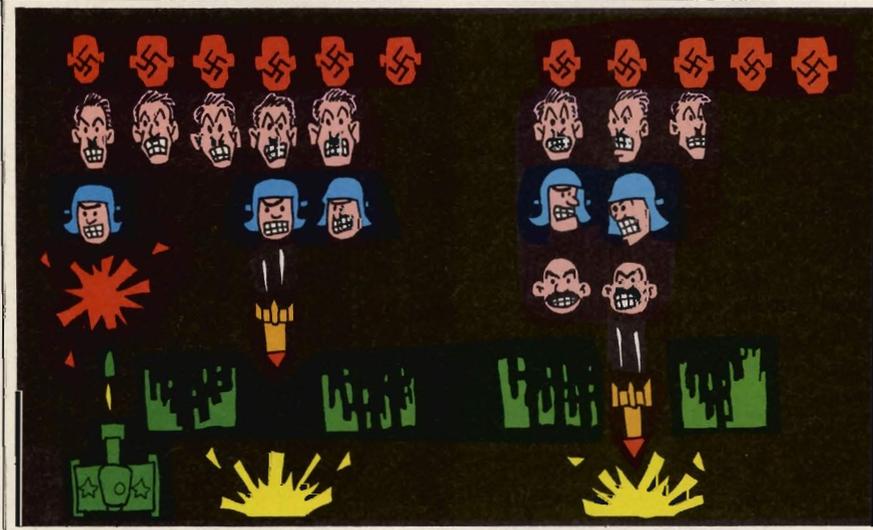

VIDEO GAMES HAVE REACHED THAT DIVINE PINNACLE ONCE HELD BY COMIC BOOKS, ROCK'N'ROLL, AND T.V. - PARENTS AND CIVIC LEADERS WANT TO MAKE THEM EXTINCT. ACCORDING TO THESE AUTHORITIES, VIDEO GAMES CAUSE EVERYTHING FROM BLINDNESS, DRUG ADDICTION AND PHYSICAL DEFORMITY TO BAD ATTITUDES, LOW GRADES AND MILLIONS OF SCHOOL DROPOUTS.

THE REAL REASON THESE SOURPUSSS WANT TO STOP VIDEO GAMES IS THAT THEY DON'T KNOW HOW TO HAVE FUN

AND CAN'T STAND THE IDEA OF ANYONE ELSE HAVING ANY. MISERY LOVES COMPANY. THEY DON'T UNDERSTAND THAT VIDEO GAMES ARE CREATING A RACE OF SUPERIOR BEINGS ABLE TO CLIMB TALL BUILDINGS, KILL ALIEN INVADERS, AND SAVE THE WORLD WITH THE PUSH OF A BUTTON.

PEOPLE WHO WANT TO STOP VIDEO GAMES ARE LIKE THOSE FOLKS WHO THOUGHT HUMANS WOULD NEVER FLY OR THAT RADIO BROADCASTS WOULD KEEP PEOPLE OUT OF BALL PARKS. THEY'RE

AFRAID OF THE FUTURE, AND VIDEO GAMES ARE FUTURE SHOCK TO THEM. BUT THE REAL DANGER ISN'T THAT THESE SMALL MINDS WILL CLOSE DOWN THE ARCADES OR OUTLAW THE MACHINES. WHEN PARENTS PTAS AND THE MORAL MAJORITY START DEMANDING "EDUCATIONAL GAMES" WATCH OUT! BE WARNED - JUST AS THEY CLEANED UP SATURDAY MORNING CARTOONS, THEY'LL TAME VIDEO, TOO. SO KILL, MAIM AND BLOW UP WHILE YOU CAN - YOUR DAYS MAY BE NUMBERED.

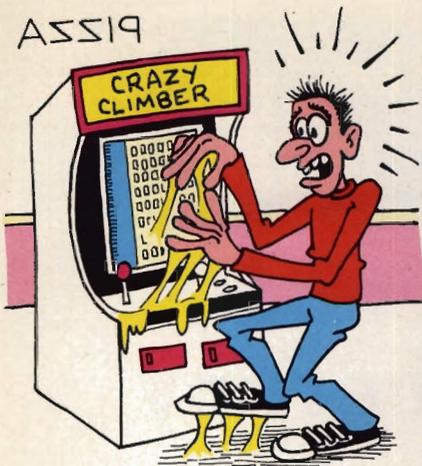

I DON'T UNDERSTAND WHY DESIGNERS COME UP WITH SUCH ANONYMOUS OPPONENTS. I JUST CAN'T GET ALL THAT WORKED UP OVER BLASTING ALIENS, ASTEROIDS, OR CENTIPEDES. MAYBE IT'D BE TOO TACKY TO PUT TOGETHER AN EL SALVADOR GAME OR A BLOW-UP-YOUR-LOCAL-HIGH-SCHOOL BOUT, BUT WHY NOT VID VERSIONS OF KILL THE COMMIES OR NUKE THE NAZIS? WE NEED MORE TASTELESSNESS IN GAME DESIGN. I UNDERSTAND THAT THE SAME DAY THE BRITISH FLEET SAILED FOR THE FALKLANDS, PREXTEL (THE UK. VERSION OF WARNER'S QUBE) CARRIED A GAME CALLED SINK THE ARGENTINE. NOW THAT'S MORE LIKE IT!

IT'S VERY DIFFICULT TO MEET GIRLS IN ARCADES. I DON'T KNOW WHY. THERE'S SO MUCH DEATH AND DESTRUCTION, NOISE AND FLASHING LIGHTS - HOW MUCH MORE ROMANTIC CAN YOU GET? PROBLEM IS, MOST GIRLS COME IN WITH THEIR BOYFRIENDS OR TO GET AWAY FROM PEOPLE. AND MORE MEN THAN WOMEN PLAY GAMES, ANYWAY. PLAYING GAMES ON A DATE CAN BE A GOOD THING, THOUGH. IT'S A GREAT WAY TO BREAK THE ICE (OR RELIEVE BOREDOM). IF YOU'RE LUCKY, YOU MAY FIND A COMMON INTEREST. JUST REMEMBER THAT IT'S VERY HARD TO HAVE AN INTIMATE TALK WITH SOMEONE WHILE YOU'RE PLAYING A VIDEO GAME.

VIDEO GAMES ARE SEXY. A FRIEND OF MINE POINTED OUT THAT GIRLS LIKE PAC-MAN BECAUSE THE PAC-MAN ENGULFS ITS OPPONENTS, ECHOING FEMALE SEXUALITY, WHEREAS MOST VIDEO GAMES FEATURE PHALLIC SYMBOLS SHOOTING BULLETS OR ROCKETS AT FOREIGN BODIES. DONKEY KONG IS A ROMANTIC FANTASY FOR BOTH PARTIES. WOMEN CAN FANTASIZE ABOUT BEING HELD AGAINST THEIR WILL BY A BIG, DUMB APE WHILE MEN CAN DREAM ABOUT RESCUING SAID WOMEN BY BLOWING UP BARRELS. MAYBE THIS IS THE GAME FOR YOU AND YOUR DATE.

ASSI9

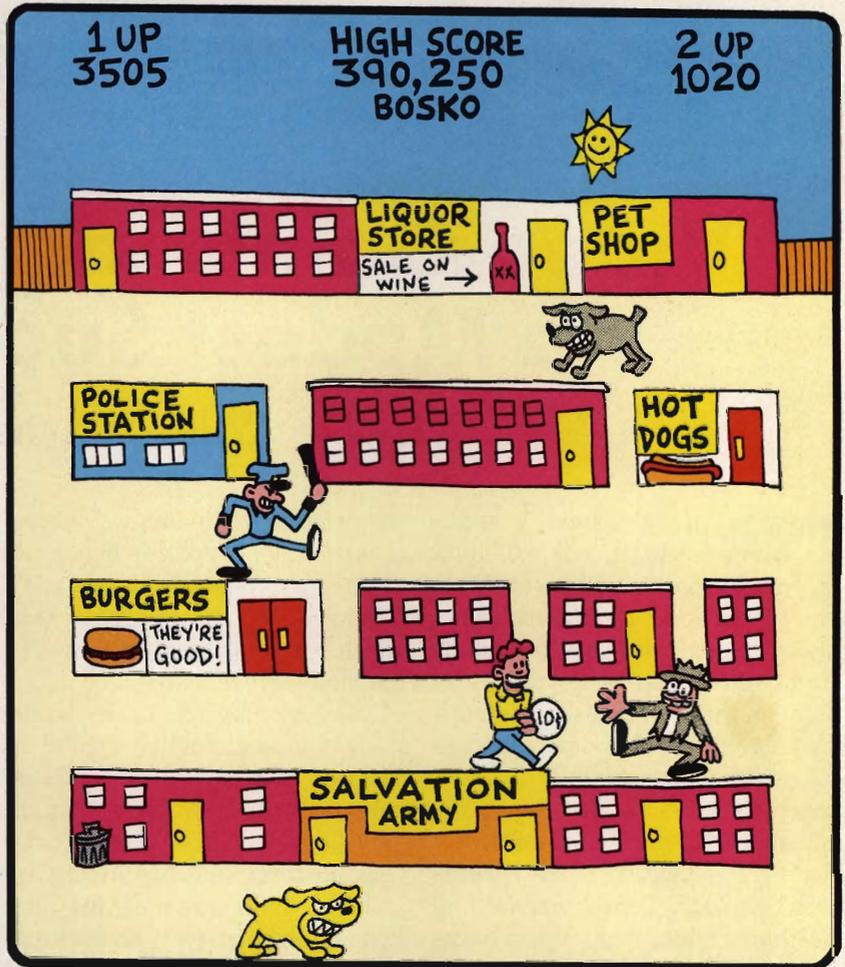

MY FAVORITE PLACE TO PLAY GAMES IS A NICE, SLEAZY BAR. TO SIT DOWN IN A NEUTRAL CORNER, POP A COLD ONE, AND PEACEFULLY KILL OR BE KILLED IS MY IDEA OF PARADISE ON EARTH. ALAS, SUCH IDYLIC LOCATIONS ARE FEW AND FAR BETWEEN. TOO OFTEN YOUR ONLY CHOICES ARE ARCADES OR PIZZA PARLORS.

PIZZA PARLORS ARE THE PITS. THE LIGHTING IS TOO BRIGHT, THE MACHINES ARE GREASY AND THE PLAYERS ARE USUALLY NASTY BRATS. IT'S NO FUN TO HAVE FIVE OR SIX RESTLESS KIDS STANDING AROUND STICKING QUARTERS ALL OVER THE MACHINE AND WAITING FOR YOU TO FAIL. IF THEY'RE IMPATIENT, THEY JUST STICK 'EM IN WHILE YOU'RE PLAYING. THE WORST ONES ARE IN SUCH A HURRY THAT WHILE YOU'RE TRYING TO STAY ALIVE THEY'LL TAP YOU ON THE SHOULDER AND ASK, "HEY, ARE YOU NEXT? IS THAT YOUR QUARTER? HEY - DINCHA HEAR ME? ARE YOU NEXT OR WHAT? OH, GOOD, YOUR GAME JUST ENDED!"

ARCADES ARE BETTER THAN THE PIZZA PITS, BUT THERE ARE DRAWBACKS THERE, TOO. OPERATORS DON'T ALWAYS TAKE CARE OF THEIR MACHINES AND YOU MAY BE RISKING A QUARTER JUST TO FIND OUT WHETHER THE MACHINE WORKS OR NOT. BEWARE OF "PLAY AT YOUR OWN RISK - NO REFUNDS" SIGNS.

DRUNKEN BUM

DONKEY KONG OPENED UP A NEW FRONTIER FOR VIDEO GAMES - A STORY LINE. YOU GOTTA HOPE THAT DESIGNERS CONTINUE TO CREATE SUCH IMAGINATIVE GAMES USING SIMILARLY WACKO IDEAS. RUMOR HAS IT THAT CARTOONIST BILL GRIFFITH - CREATOR OF ZIPPY THE PINHEAD - IS DESIGNING A ZIPPY GAME. GREAT! MAYBE IF THE DOOR IS OPENED UP FOR MORE NEW TALENT WE'LL SEE BETTER GAMES.

I HAVE AN IDEA FOR A GREAT GAME. IT'S CALLED **DRUNKEN BUM**. IT FEATURES A BUM WHO STUMBLES THROUGH STREETS AND ALLEYS AVOIDING POLICEMEN AND BIG DOGS, PICKING UP SPARE CHANGE AND ENOUGH BOTTLES TO GET DRUNK BEFORE IT GETS DARK AND THE LIQUOR STORES CLOSE. WHO WOULDN'T WANT TO BE A DRUNKEN BUM FOR A FEW MINUTES, RIGHT?

OUT OF ALL THE GAMES IN THE ARCADES RIGHT NOW, I STILL THINK **BERZERK** HAS THE BEST TARGETS. THOSE ONE-EYED ROBOTS ARE VERY CREEPY AND DEFINITELY DESERVE TO DIE. **BERZERK** IS A VERY PARANOID GAME. YOU'RE LOCKED IN A ROOM WITH ALIEN ROBOTS WHO WANT TO KILL YOU. THERE'S NO SAFE PLACE IN THE ROOM AND EVEN THE WALLS ARE DEADLY. IF YOU DO MANAGE TO ESCAPE, YOU JUST ENTER ANOTHER ROOM WITH EVEN MORE ROBOTS.

VIDEO GAME MANUFACTURERS ARE MAKING A BIG MISTAKE BY RAISING THE STAKES TO FIFTY CENTS. THAT'S WHAT KILLED PINBALL. FIRST THEY CUT BACK FROM FIVE TO THREE BALLS AND THEN JUMPED THE PRICE. VERY BRIGHT. IT WOULD BE LIKE BASEBALL GIVING YOU SIX INNINGS INSTEAD OF NINE. SO VIDEO GAMES CAME ALONG AND HAVE NEARLY PUT THE PINBALL COMPANIES OUT OF BUSINESS. OF COURSE THEY'RE NOT THAT STUPID. THEY'RE FIGHTING BACK, FIRST WITH MULTI-LEVEL, SUPER-SONIC PINBALLS AND IF THAT DOESN'T WORK (IT DOESN'T LOOK LIKE IT WILL) WELL, THERE'S ALWAYS VIDEO.

DR. VIDEO

Video Games as Therapy a Modest Success

By Dr. William Lynch

The use of videogames in therapeutic or educational settings is not uncommon. However, the typical application of the games in these contexts has been to employ them as rewards for performing adequately on some other task. It is much less common to employ videogames as therapy in and of themselves.

In 1978, the Brain Injury Rehabilitation Unit (BIRU)—which I am director of—at the Palo Alto Veterans Administration Medical Center acquired an Atari home videocomputer system (VCS) for the purpose of providing recreation and reinforcement for patients undergoing rehabilitation for various brain disorders. It occurred to me that certain of the games contained elements that could be of benefit to several of our patients. Since many brain-impaired persons encounter problems with alertness, attention, concentration, memory, and perceptual-motor skills, it seemed logical to utilize videogames as a means of improving these functions. I thus began, with the assistance of BIRU staff member Tom Ragain, to collect data in a more systematic fashion.

We began by prescribing videogames therapy to certain patients who exhibited problems with reaction time, alertness, memory or eye-hand coordination. Our first intention was to simply observe a number of patients with a variety of brain disorders in order to determine whether brain-impaired individuals could learn the skills required by

the games. Eventually, we wanted to evaluate the relationship between skill at playing certain video games and performance of practical “real-life” abilities which bear upon the patient’s ability to function independently.

To backtrack a bit, the first scientific study of videogames appeared in 1978. The study was carried out at SRI International by Charles Rebert and David Low, and dealt with the brain’s response to various cognitive activities, including both watching and playing Pong. They inferred brain hemispheric activity by measuring alpha activity on the EEG (the electroencephalograph records and detects brain waves). Among their findings were the observations that the brain seems to show increased right hemisphere activation when one either watches or plays Pong. Right parietal activity is evident under either condition (while watching or playing) while central and temporal activity increased when the subjects played Pong.

A more recent study by Renee Okoye and Tony Hollander, both Occupational Therapists working in the New York area, suggested that a program of structured videogames training was more effective than standard fine-motor skills training in a small sample of learning disabled children. They provided two similar groups of learning disabled children with identical gross motor skills training; one group was given standard fine motor skills training, while the other received 30 minutes

of Atari videogames such as Air-Sea Battle and Brain Games. After 12 weeks of training (twice a week) the groups were compared on a variety of independent pre- and post-treatment measures. The videogames-treated group was found to have improved by “at least one standard deviation” on measures of eye-hand coordination and kinesthetic awareness. The control subjects failed to demonstrate the degree of improvement shown by the experimental group.

Which games are most useful?

Although there are a number of games that we have found useful, we have attempted to prescribe one game which the majority of patients can learn to play. The result of our effort led us to select Atari’s Breakout as the “common game” shared by the majority of patients (the reason for this will be explained shortly), but most Atari game programs can be divided into four categories.

Games involving verbal/mathematic skill: Verbal games are unfortunately quite rare among videogame programs. Atari’s Hangman is the only program which requires spelling ability. Mathematic games are more plentiful. Aside from the obvious Fun With Numbers program, we have used Codebreaker, Blackjack, Brain Games, and Casino, all of which require rapid mental calculations. Often, patients who resist the more traditional math drills con-

©1982 Spindler & Ferrandes

enthusiastically to a card game program which somehow does not appear to be as dull as traditional mathematics lessons seem to be.

Games involving memory: There are two excellent game programs which require efficient immediate memory for number sequences as well as for designs and spatial sequences. The Brain Games program contains three helpful games: Touch Me is a game in which the patient is confronted with a 3 x 2 or 3 x 3 matrix of blank rectangles. His task is to recall the sequence of rectangles which are highlighted both by the words "touch me" as well as by a specific auditory tone. The patient thus can rely on auditory or visual memory (or both) in order to succeed at the task. Picture Me requires the patient to recall a sequence of four geometric shapes and Count Me is a videocomputer version of the standard Digit Span task. In the Concentration game program, a version of the venerable TV game show of the same name, the patient must recall the location of various objects which are revealed briefly on a 4 x 4 or 5 x 6 square matrix.

Games involving perceptual-motor skills: There are a number of game programs which are helpful in remediating slowed eye-hand coordination. As mentioned above, we have used the games

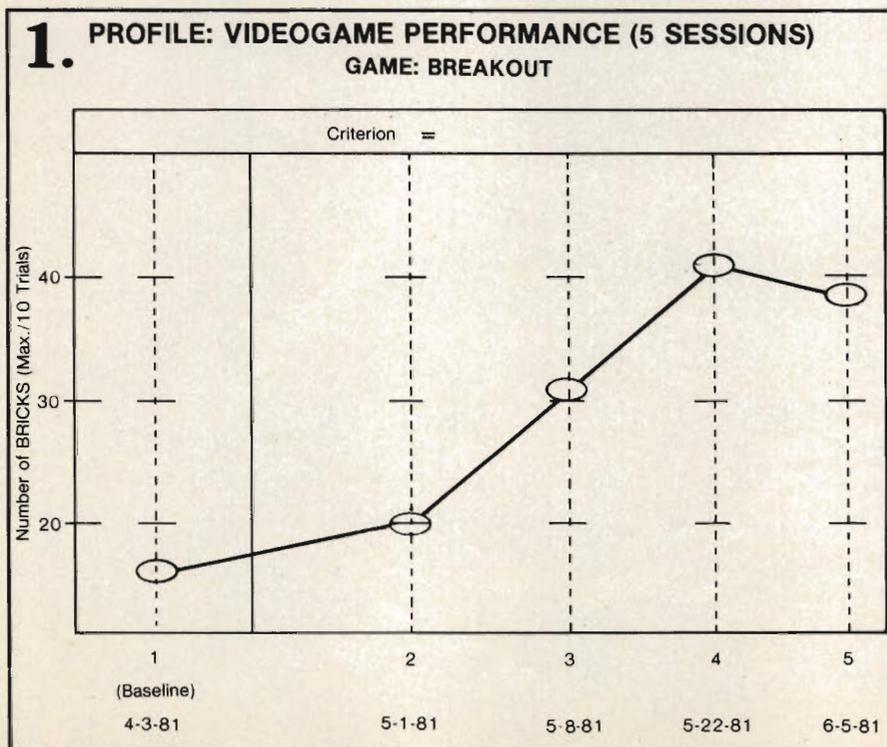

Brain-injured patient "breaks out" of his shell thanks to Atari's VCS.

Breakout and Super Breakout with many of our patients. These games require quick reaction time, smooth visual tracking and estimation of speed. The eye movements required are not simply horizontal (as in Pong), but are also vertical and oblique as well. Some other games which have been found to be helpful include the various driving-related programs such as Night Driver, Dodge 'Em, Indy 500, Slot Racers and Street Racers. We've found Air-Sea Battle, a shooting gallery game in which targets emerge either from the right or left of the video screen at varying

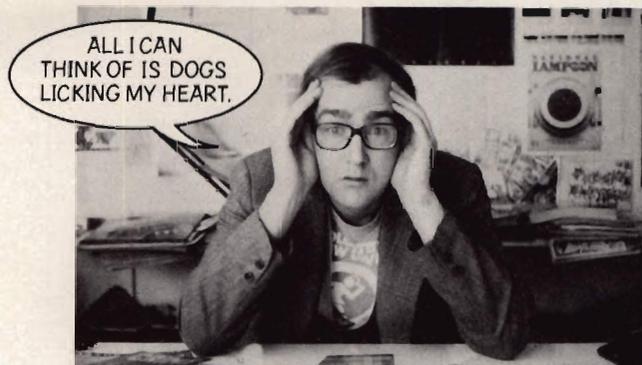

speeds and levels, aids patients who have problems with reaction time (either too fast or too slow) or lateral visual tracking. In order to perform well, the patient must respond promptly, but not impulsively to the objects which appear at unpredictable locations and speeds.

Due to the complexity of visual information which the patient must process simultaneously, popular games such as Space Invaders, Asteroids and Missile Command have not proved helpful with most of our patients. These programs, along with the additions of Pac Man and Defender, may be best utilized as rewards for mildly impaired patients who are better able to accommodate the great amount of information required in order to play these games successfully. The same could be said of most of the sports games (Basketball, Football, Home Run and Pele's Soccer); they tend to be too complex for most patients to enjoy. I should note that the various programs marketed by Activision have been of value for some of our patients. The Freeway game, in which the player must move a chicken across a highway, is helpful in training to utilize judgment, anticipation and estimation of speed of objects.

Table Games: As a rule, we have not found games such as Video Chess, Video Checkers, Backgammon and 3-D Tic-Tac-Toe to be especially useful because of the difficulty in learning the rules. The 3-D Tic-Tac-Toe game is in-

triguing, but the four 4 x 4 planes which the patient must attend to are too confusing for the great majority of those with even mild impairment.

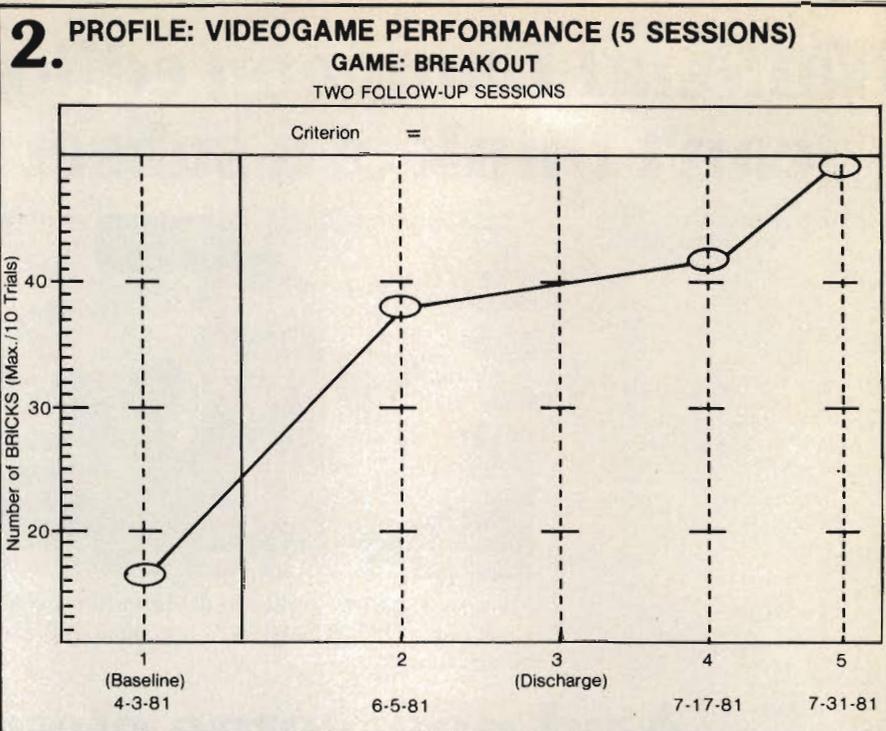

Findings at BIRU

At the BIRU, we have been gathering data on videogame performance of patients with a variety of brain disorders. Figure 1 illustrates the performance of a patient who sustained a closed head injury approximately one year prior to beginning training on the Breakout game. The initial score represents his baseline level of performance which is a score of 12. In our experience, most normals attain an initial Breakout score of around 100 (maximum score for first 10 games). The chart indicates that this patient quickly improved his level of performance on the next four sessions; after two months (weekly sessions) he had bettered his score to the 37 to 41 range. At the same time, he showed improved alertness, faster reaction time and smoother (but not normal) eye-hand coordination.

Figure 2 represents the Breakout data for this same patient at four different times: baseline; after 2 months of treatment; one month after discharge (with no treatment since discharge); and six weeks after discharge. The results show that he was able to maintain (in fact, he improved upon) the skill level attained prior to discharge.

Our findings with other patients have been promising, although we do not consider such preliminary observations to be conclusive. We have begun to compare the performance of our patients on videogames with their abilities on independent, yet related, measures of alertness and general responsiveness to the environment.

In the near future, our plan is to obtain periodic samplings of each patient's mental status, reaction time and perceptual-motor skills and to then systematically introduce or withdraw videogames training in order to determine the effects (or lack) of the training upon these independent measures. Finally, we would like to define the relationship between skill on videogames and the patient's Activities of Daily Living or ADL. After all, it is the patient's level of independence and ability to cope with the requirements of the real world which concern us. We are not inter-

ested in improving skills on videogames unless these skills have practical significance for the patient in the course of his/her rehabilitation.

Future developments

The use of videogames and computer-assisted retraining in rehabilitation should continue to increase, though due to severe budget restrictions the expanded use of this methodology may be slowed in many parts of the country. I am certain that the major microcomputer manufacturers such as Atari, Apple, Radio Shack and Commodore will gradually release more software designed specifically for use with disabled populations.

Meanwhile, clinicians with expertise in computer programming have already begun to write their own programs for such use. Psychologist Dick Bracy at the Community Hospital of Indianapolis has written a series of programs (for Atari's 400 and 800 computers) which are designed for use with patients following brain trauma or stroke. These programs deal with such abilities as attention-shifting, initiation/inhibition skills, discrimination and differential responding. Dr. Rosamond Gianutsos of Adelphi University in New York has also written a number of programs (for the Radio Shack TRS-80 microcomputer), which are useful in treating visual-perceptual as well as memory disorders.

I have included the mailing information for both Dr. Bracy's and Dr. Gianutsos' software and price list for the reader's convenience. Additionally, both the Atari Institute for Educational Action Research and the Apple Institute have extensive software libraries containing programs which are helpful in retraining brain-impaired patients.

With advancements in software sophistication and graphics, videogames and computer programs in the near future will provide the clinician with a valuable tool for the diagnosis and rehabilitation of brain impairment of various types. Games will continue to be enjoyable, but their tremendous potential as teaching aids has yet to be appreciated.

I am convinced that part of the problem with the public's timidity about videogames lies in the fact that we are unable to accept as beneficial anything that also happens to be enjoyable. The generally bad publicity surrounding arcades, while justified at times, does seem to result, in part, from a conviction that if our kids are doing it, it has to be bad for them. Parents, many harkening back to the legend of the Pied Piper, see videogames as having the capacity to lure their children away from the responsibilities of family and school. Surely, there are some who spend excessive amounts of money and time

(Continued on page 79)

No one wakes up thinking, “Today I’m going to abuse my child.”

Abuse is not something we think about. It's something we do. It runs against our nature, yet it comes naturally. It's a major epidemic and a contagious one. Abused children often become abusive parents. Abuse perpetuates abuse.

Child abuse is a major cause of death for children under two. Last year in America, an estimated one million children suffered physical, sexual or emotional abuse and neglect (many cases go unreported). At least 2,000 died needless, painful deaths. And if you think child abuse is confined to any particular race, religion, income group or social stratum,

you're wrong. It's everybody's problem.

What's being done about prevention? Not enough. Preventive facilities are simply inadequate. Most social agencies deal with abusers and their victims after the damage has been done.

Child abuse doesn't have to happen. With your help, most abusers could be helped. Your community needs your aid in forming crisis centers, self-help programs for abusers, and other grass roots organizations. Please write for more information on child abuse and how you can help.

What will you do today that's more important?

Abused children are helpless. Unless you help.

COIN-OP SHOP

AOE Report: Showdown in Chi-town

By Steve Bloom

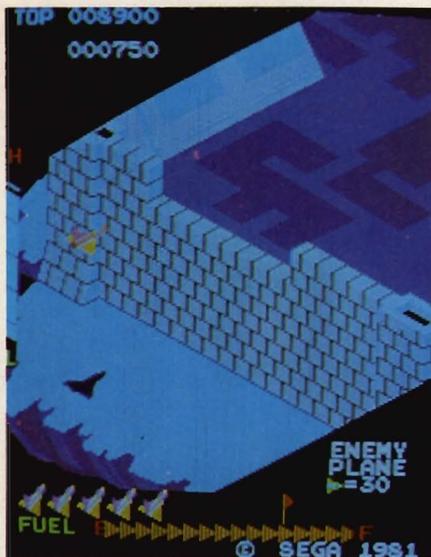

Twice a year, the video game and pinball manufacturers, distributors and operators (arcade owners and route-runners who split the coin-box take 50-50 with bars, bus stations and wherever else these fine games are found) convene in Chicago—the original home of the coin-operated amusement business. During the first weekend of

val-like creations are screaming out to be liked, but sadly, most will return from whence they came never to be toyed with again. In one sense, the AMOA is a cruel, cold-blooded, affair.

Very much the same can be said about the AOE, or Amusement Operators Expo—the upstart showcase organized by one of the industry's two trade publications, *Play Meter*. Only three years old (compared to the 50-plus AMOA), the AOE has quickly assumed the role as a purposive mid-season festivity, fully attended by all the manufacturers (except for Atari, whose feud with the magazine has kept them away), operators and press. Held during the last weekend of March, it has proved to be as comprehensive an exhibit as the AMOA and even somewhat more informative. Seminars catering to operators' particular needs and interests distinguish the AOE from its fall counterpart.

I attended the recent AOE, which was staged at the Chicago Hyatt from March 26-28. What follows is a diary of three whirlwind, game-filled "daze."

get a fix on the three videos "Most Likely to Succeed" in 1982. I say surprisingly because each of the four previous superstar games—Space Invaders, Asteroids, Pac-Man and Defender—all escaped the tastemakers' smarmy predilections in the past. Williams' **Robotron 2084** (created by Eugene "Defender/Stargate" Jarvis and Larry "Stargate" DeMar) combines the speed and control board simplicity (two eight-way joysticks, one for firing, the other to move) of Tempest, Defender's compulsion to save humanity from some awful deed and Berzerk's basic shoot-'em-up stra-

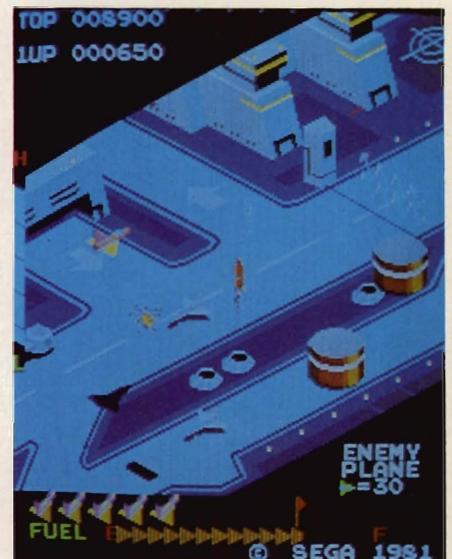

1 You may end up climbing the walls figuring out this ZAXXON maneuver.

November, the Amusement & Music Operators Association (AMOA) invites its members to Chi-town for their annual event. Essentially, the AMOA trade show is the largest arcade in the world—hundreds of cacophonous coin-eaters stationed on the floor await the verdict of thousands of jurors, who move slowly from booth to booth, noting the qualities and deficiencies of each. All of these loud-mouthed, carni-

Friday, March 26

I arrive at the Hyatt at noon. Since the floor closes at four, I begin scurrying around the maze of exhibits at a furious clip. Like Pac-Man, I ravenously gobble up one blaring booth after the next. With little time to waste, I stop momentarily to jot down the features of a new piece in my pad, then move on. No playing today. This, mind you, is not easy to do since all the machines are set on credits—in other words, they're free!

Surprisingly, it doesn't take long to

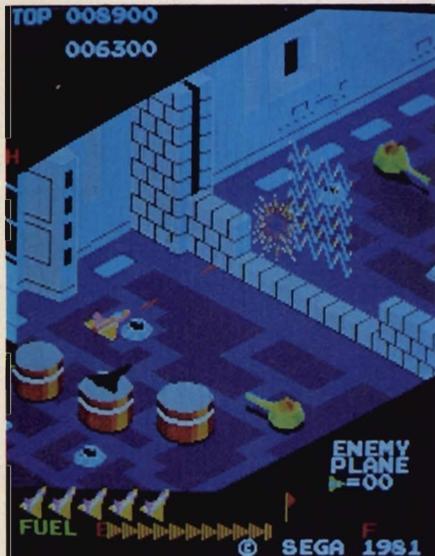

2 Strafing the fortress' fuel tanks is key to survival in space.

tegy. It's more or less a Berzerk Deluxe.

DeMar confirms this assessment when he admits that both he and Jarvis are Berzerk bonzos. Another inspi-

ration was Midway's Omega Race. This I discover as Ron Halliburton, Omega's principle designer, stands poised at the controls, giving "Robo" (as DeMar calls it) a whirl. Explains DeMar to Halliburton none too tactfully: "A lot of what you did in Omega Race we decided to follow." Halliburton mumbles and skulks away.

Robotron has something to do with "critical mass" or so I'm informed by DeMar. Robots take over the world, computers develop minds of their own and we're all left bowing before the

3 Slip through the opening in this fence or suffer the usual consequences.

gods of Three Mile Island—something like that. Appointed the task of rescuing your family—Mom, Dad and little brother, Mikie—from an assortment of mechanical beasts, Robo is one helluva responsibility. If you ask me, it's more of a "critical mess"; it also happens to be the best new game on the floor.

Gottlieb's new video, *Reactor* (by Tim "Star Castle/Rip-Off" Skelly), is not easy to explain, but I'll try. See, you're an oblong atomic particle that must keep itself from hitting the walls by a pulsating, ever-expanding nuclear core. The trick is to crash identical enemy particles against pins located on two of those walls—this reduces the swell of the core. Meanwhile, bonus points can be had by luring your foes with a decoy into the bounce chamber. There is no shooting, a minimum of strategy and a heavy-metal rock soundtrack to play by. "Reactor Rocks," already reads the

t-shirt of one of Skelly's cohorts.

Finally, I come to Sega/Gremlin's *Zaxxon*, an even brasher spectacle than *Reactor*. Two factors immediately distinguish *Zaxxon*; first, its phenomenal raster graphics, which are similar to those of *Turbo*, another 'Sega product; and second, its perspective. In *Zaxxon*, you tool in a rocket diagonally from lower left to upper right (like in *Vanguard*); I guarantee, at the start, you'll have some trouble. What seems a simple climb over a wall can be cataclysmic if you don't judge the dimensions correctly. Actually, the wall is not flat, so scaling it requires some split-second maneuvering. Once you do get the swing of *Zaxxon*, though, it proves to be nothing more than a souped-up *Scramble*. And how's this for a t-shirt slogan: "Zaxxon Zux"? Only kidding.

My abbreviated tour concludes as the lights begin to dim on the Hyatt floor. I decide to visit one of several seminars scheduled concurrently. While most cater to specific operators' concerns such as technical points about machinery or business aspects of running an arcade, I find a more general session that's focusing on the continuing controversy between games people and communities. Judging by the comments of this rather large group, operators are desperately searching for a solution—any solution—to the problem which threatens to diminish their profits and conceivably put them out of business. Had I, for whatever reason, thought otherwise, this seminar makes perfectly clear that there is a great deal of trouble brewing in "river cities" all over America.

What is to be done? Well, for one thing, the manufacturers have contracted a publicity firm to help shine up the industry's muddy image. How much good that will do is another question. Indeed, one attendee cynically growls, "We are beyond good PR, beyond changing peoples' minds. People firmly believe that video games are an addiction. That's it." Ostensibly, all of the think-positive, we-will-overcome rallying the moderators try to instill goes for naught. Is the time truly past for solutions?

Saturday, March 27

Arriving this day in the AM, I con-

tinue my evaluation of the '82 crop. Two D & D (not deaf and dumb, stupid) games are creating some interest: Midway's *The Adventures of Robbie Roto* and Konami's *Tutankham*. Shown in prototype, *Robbie Roto* (created by Dave "Wizard of Wor" Nutting Associates, an independent design group that works closely with Midway) features a Pac-a-like character who dons a miner's helmet and scoops his own paths, enabling him to gather assorted buried treasures. Similarly, in *Tutankham* (short for Tutankhamen), you are enclosed in a brick maze that continues from left to right; the object is to snatch keys and open doors for prizes with them. Found patiently waiting on line for his turn, Larry DeMar sanguinely predicts that *Tut* will become an arcade hit. "It's the best *Dungeons & Dragons* game to come along so far," he says. "The only problem is you get to play too long—but that hasn't stopped operators yet."

By mid-afternoon, I sense a decided

4 Zaxxon is coming to take you away, ha ha. Avoid its missiles if you can.

resolve in the air—many operators already know which pieces they are pleased with, and which ones they will try their best to forget. Over at Taito's booth, *Alpine Ski*, a Japanese import that reminds me of Activision and Mattel's made-for-TV cartridges, is causing a mild fuss. Accustomed to ho-hum trade reaction to their innovations (*Space Invaders*, *Qix*), staffers are nonplussed by the response to this low-key, quietly infectious game. "We

thought we had a bomb, a real loser," concedes Keith Egging as he poses for corporate photos with two blushing blondes at either arm. "Boy, were we wrong."

Meanwhile, interest in Stern's **Frenzy**, the for-real Berzerk Deluxe, seems dismal. Then again, it's hard to say. Frenzy has been out on the streets for several weeks, but is that any reason for it to be totally ignored? On the other hand, the ghost town that is Cinematronics' booth, makes absolute sense. **Boxing Bugs**, **War of the Worlds** and **Jack the Giantkiller**, the company's first Japanese license (from who?), look like the kiss-of-death for this once-respected, but slowly fading games firm.

Jack the Giantkiller is but one of a slew of comical Japanese products which are literally littering the premises. All of them feature a semi-recognizable character a la Mario the Carpenter in Donkey Kong, an incredulous yarn (ie, Rock-Ola's **Fantasy**: "Pirates kidnap 'Cheri' from your Fantasy Island. The chase begins...") and, worst of all, kiddie-up, carousel-like scores. To be perfectly honest, I wouldn't mind smart-bombing them all. Get this one: As purple female shapes frug away on the screen, roller skaters and a witch try to grab them. Draw lines, like in **Qix**, to save your gals... all to a crash-crash-crash new-wave whip-style beat: What do you think they call it? Three guesses: Disco #1, Disco #2 or Disco #3. Courtesy of Data East.

Not at all stimulated by the list of seminars, I decide to attend Williams' cocktail party instead. There I meet Steve Ritchie, the originator of **Hyperball**, which essentially is Space Invaders inside a pinball cabinet and is also receiving some high marks down on the floor. Ritchie is best known for his pins creations such as Flash Firepower, and Black Knight, but sees no light at the end of the pinball tunnel and wants out.

"This is definitely my last mechanical game," he announces. "Actually, I didn't even want to do Hyperball, but Mike Stoller (Williams' prexie) forced me into it. My next project will be my first video."

What is the key to developing a hit game, I ask him?

"The key? Just think like a regular guy. Don't ever lose track of that. Don't ever try to go over the heads of the players. And never forget that the bulk of players are still kids."

By the way, Ritchie and Tim Skelly were seen by this reporter conferring in a private corner later that evening. Could it be? Is something coming, something good? Stay tuned.

Sunday, March 28

This is my third coin-op show, two AMOAs and now this AOE. If anything, I've learned the best way to work these affairs is to cruise continu-

PICK HIT: Robotron 2084.

ously for the first two days, taking plenty of notes, conducting interviews, generally schmoozing as much as possible. Then comes Sunday, the day I put the pad away, bury the Bic deep in my jacket pocket; the day I come to play. Let's just say Sunday is *my* day.

Every job has its perks and in the video games business, free plays is about as good a perk as your gonna get. Sure, we've all played TV games, all know the feeling of reaching over and simply flicking the replay switch. But coin games are an entirely different story for one very simple reason:

Quarters. At the AOE and AMOA, quarters don't exist. The shows are honest-to-goodness freebies.

Usually, my strategy is to select two games that I both like and think I may be able to reasonably progress at and then play them till my fingers crack. Last November, I chose **Tempest** and **Mousetrap**; this time I go with **Robotron** and **Frenzy**. Since Robo is constantly busy, I spend less time at it, but do learn certain key moves such as picking up my family members for extra points as soon as possible, shooting the red spheroids quickly lest they eject smaller "Enforcer Embryos" that chase after you like baiters, ignoring the hulks which are nothing but oversized pests (you don't have to kill them to complete a wave) and blasting a path from the middle of the screen (where you start) to the walls where it seems you have more security. You'll need it. As many as 80 robots clutter the screen in later rounds.

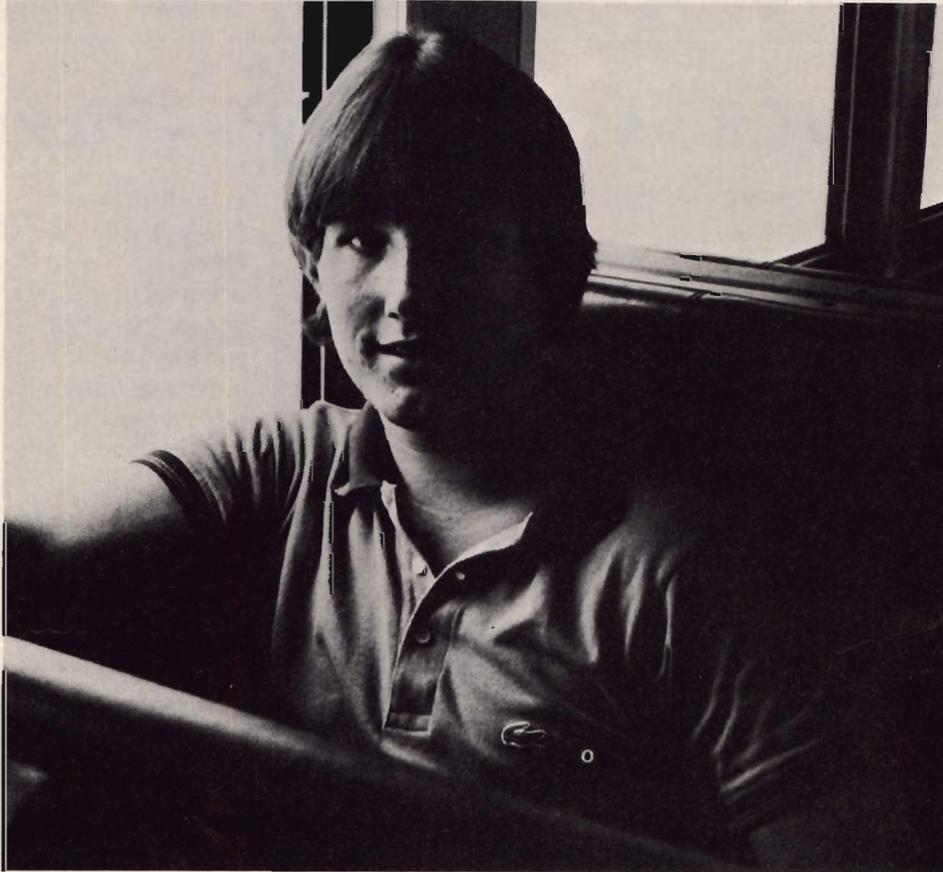

As for **Frenzy**, I had seen it before but never had the chance to play consecutively for an hour, no less ten minutes. Like **Berzerk**, it is a low-scoring, frustrating game, yet I still love it. Something about sniping at robots in a maze brings the crazed assassin out of me. Some of the essential differences between **Frenzy** and its predecessor are: 1) the robots—in **Frenzy**, there are two types, dumb (fat) and smart (thin); 2) the walls—in **Frenzy**, there are two types, corrugated (these can be chipped away) and solid (these can't and cause treacherous ricochets); 3) **Otto**—in **Frenzy**, this previously indestructible devil can be had with three blows, but reincarnates and streaks back across the screen twice as fast. I've heard of someone canning **Otto** eight straight times, though twice is quite a feat in itself.

After resetting **Frenzy** somewhere between 50 and 100 times, I can record no more than 4500 points. This, however, places me seventh on the machine's memory board. Maybe Larry DeMar had a point when he complained to me about **Frenzy** earlier in the weekend. "Why play a game that lets you kill yourself?" DeMar contended, referring to the samurai ricochet shots that seal your coffin in a cinch. Did he ever consider that we might all be masochists? Huh? □

Brent Ragon saved a life with Red Cross CPR.

A Public Service of This Magazine
& The Advertising Council 

Could you?

Fifteen-year-old Brent Ragon had no idea how soon he'd be using CPR to save someone's life when he completed his Red Cross training at a Youth Safety Seminar.

But, while Brent was riding the train home from that seminar, a man collapsed two rows behind him.

"He wasn't breathing, and I couldn't find a pulse," Brent recalls. "I wasn't scared. I didn't have time to be scared. I knew what to do and I did it."

If you were in Brent's place, would you know what to do?

We'll teach you.

HARD SELL

Atari's VCS vs. Odyssey²—Pick 'em

By Randi Hacker

The Model-T of the TV-games business was a modest-looking plastic box named Odyssey 100. Released in the fall of 1972 by Magnavox, it would sell some 100,000 units before America tired of it. A year later, when Atari brought forth a home version of the ever-popular Pong game (it had 100,000 or so buyers), the games race was on.

These systems were not programmable, meaning the hardware contained all the games that could be played; cartridges, at the time, were something you plugged into your tape deck. In other words, software for TV-systems didn't exist.

This all changed radically in 1976 with the invention of the programmable machine. First, Fairchild Camera & Instrument introduced its \$170 Channel F, featuring cartridges at \$20 apiece. Bally (Professional Arcade) and RCA (Studio II) followed suit, but soon discontinued this line—as did Fairchild—when they found consumers less-than-enthused about such a fanciful expense.

Relying more on vision and savvy than sales figures, both Atari and Magnavox once again plunged into the TV-games business. In 1977, Atari released their Video Computer System (VCS), the machine that would become the standard for the industry. A year later Magnavox provided Atari with its only competition in the field. Not only did Odyssey² match the VCS' list price (\$199), but included a keyboard in the package.

While Atari and Mattel, whose Intellivision system has received a great deal of attention since appearing on the scene in 1980, continue to slug it out in what seems a never-ending advertising brawl, Magnavox (now owned by

—both price-wise and in terms of graphics, gameplay and available software.

For all of these reasons, the first edition of "Hard Sell" will be devoted to a point-by-point comparison of the two most reasonably priced TV-games systems presently on the market.

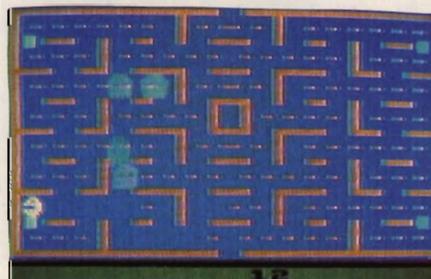

Price

A call to Toys-R-Us in New York revealed that, at least in some locations, there may be no more than a two dollars difference between the two systems. On sale, the prices were: Odyssey²—\$138, VCS—\$136.

Hardware

The VCS and Odyssey consoles are about the same size and weight. The essential distinction between the two boxes—aside from what may be inside them—is that Odyssey² comes equipped with an actual keyboard. Even though it's of the touch-sensitive, non-typewriter variety, it still works. Unfortunately, there's not a whole lot you can do with it. Only the Keyboard Creations cartridge allows you to play around with this alpha-numeric feature. By pressing the number 1 key, you are entitled to leave a message of up to 99 characters on the screen. Number 2 converts the TV into a timer; leave a specific message, set a time and go take a nap while the bread rises—an alarm will wake you out of your slumber. Number 3 is an actual digital clock and so on. And you thought that all you could do with your system is play Asteroids or UFO?

There's really not much to say about the VCS console. It has buttons for "reset" and "game select" (some carts have as many as 112) on top and "difficulty switches" (B for regular, A to handicap) located on the back. Most people who

SOMETHING FOR EVERYBODY: Keyboard Creations, Pac-Man and UFO.

the industry will deny that the VCS North American Phillips) is content to keep a relatively low-profile. But, few in the industry will deny what the VCS and Odyssey² are the more comparable systems. In fact, Bally's Professional Arcade, which is now owned by Astrovision, matches up with Intellivision more consistently than does the VCS

have the VCS don't even know they own a computer.

Software

Right now, more cartridges are being made especially for the VCS than any other system. Since at least three-quarters of American households that are hooked into video games own "an Atari," this makes perfect sense. In addition to the 45 that Atari provides, Activision, Imagic, Apollo, Coleco and Parker Brothers are all busy churning out new games that are "Atari-compatible." Some even believe these carts are of higher quality than Atari's very own. That's certainly debatable and also not the point of this article.

Atari is best noted for its arcade conversions, such as Space Invaders, Asteroids, Missile Command, Super Breakout and now Pac-man, and for good reason—the rest of its catalogue, with only a few exceptions, is second-rate. It's also old. The same can be said about the Odyssey². Of the 40 carts, only its most recent creations are worth playing. Most innovative of those is Quest for the Rings, a combination board and video game. So successful was this game that N.A.P. has already added Conquest of the World and the Great Wall Street Fortune Hunt to what they are now calling their "Master Strategy Series." All sell for \$49.95.

Most new Odyssey carts retail for \$32.95 while Atari's Pac-Man costs \$37.95 (though I've already seen it discounted to \$26).

K.C. Munchkin VS. Pac-Man

(Editor's note: Though N.A.P.'s K.C. Munchkin game has been outlawed by a federal judge, it is nevertheless instructional to compare it with Pac-Man. You will see why.)

Anyone who buys Pac-Man because they love the arcade game with the same name may wind up disappointed. Other than retaining the basic game concept, it bears few similarities to the "real" Pac-Man. There are dashes instead of dots and "power pills" rather than "energy capsules." A square-shaped "vitamin"—no fruits or keys—serves as a bonus. There is no music.

Pac-Man himself doesn't look well. He's a bit square and seems to be lacking in the motor skills one might expect of him. He just doesn't zip around those corners in the maze like you're used to.

Inky, Pinky, Blinky and Clyde?), they're all shadows of their former selves (no pun intended). They flicker and fade and it's really hard to tell when they've changed colors, much less see them at all. At least once a game I lose a life because I think they're still blue. Oh well.

There are eight game variations, only two of which ("fast" Pac-Man with either ghosts "jogging" or "running" after him) could challenge even novices. The exits on the top and bottom, at times, seem involuntary; on several occasions, as I passed by one, I was sucked in and spat out the other side. When the maze is completed, another one immediately—like, in half a second—replaces it. Plus there's no show.

This is not to say K.C. Munchkin is (sorry—was) so much better a game than Pac-Man—it's just better. And more fun. K.C. may also lack that lovable chubby figure, but he does have a charming personality and even smiles. Everytime K.C. comes to a halt, he

turns to face you with his little antennas up and grins. In game five (there are nine), whenever K.C. moves about, the maze disappears. But holding him in one place not only causes the maze to reappear, but K.C. smiles repeatedly. This is always good for a laugh.

There are fewer dots in K.C. Munchkin (they move around) and so-called "munchies" give the Munchkid his momentary edge. Something about the sound when K.C. gobbles up a ghost (which, by the way, is identical in appearance—but more visible—to those in Pac-Man)—a crisp, final sort of munch—appeals to me more than the one in Pac-Man.

Since all things are not unequal, allow me to say that both joysticks stink. Too often they prevent you from making the move you had intended and usually you discover that you're suddenly the odd man out. In my humble opinion, this is a good enough reason not to bother much with either game (not that the courts have allowed us the

choice) and take a stroll back into the arcade.

Graphics

The visuals for both systems are angular. There is essentially no roundness to the figures, but this doesn't prevent you from recognizing which character is which. The rocket in Asteroids, for instance, looks like a small pyramid built out of sugar cubes; nonetheless, one still knows it's a rocket.

Except for some of the miraculous cartridges designed for the VCS by Activision and now Imagic, the graphics on this machine are suspect. Same goes for Odyssey².

Joysticks

These sound more provocative than they are, but surely everyone knows *what* they are by now. Atari packs three different sets of controllers (joysticks, paddles and keyboard) with the VCS while the Odyssey² comes just with one—joystick.

Both sticks move four-ways and have a fire button. The Odyssey's feels as loose as the VCS's is stiff. Neither is a joy when it comes to precision handling.

Still, the VCS gets the most out of its joysticks. Not only can you move and fire with it, but install shields, flip 180 degrees and hyperspace. I might add that I have no complaints whatsoever with the paddles.

Conclusion

In comparing the two systems, most everything about them is either equally pro or con. Regarding sounds, graphics, controls, features and so on. The most fundamental difference actually has nothing to do with the systems per se. Due to fabulous advertising, strong marketing and non-stop word-of-mouth, Atari has taken an almost insurmountable lead in the TV-games marathon. (They also already own some of the best arcade games thanks to their coin-op division.) Why is Atari able to buy the rights to Pac-Man and not N.A.P.? Simple. Because they're the Boss in this business, they call most of the shots. Meanwhile, the Odyssey², a capable though outdated system is forgotten by the vast majority of consumers looking to purchase games for their homes.

In any event, price-wise you can't beat 'em. The VCS or Odyssey², that is.

BOOK BEAT

How-to They Do

Publishers are betting a megabuck that books (a 15th century technology) are going to be just the thing that all you vidiots need to tame your favorite 21st century games. They may be right, but the way it happened is kinda funny. Book publishers have always been a little slow, so last fall, just about the time the 50 millionth video quarter was settling in a coin box, a memo went out to every book editor in New York. It read:

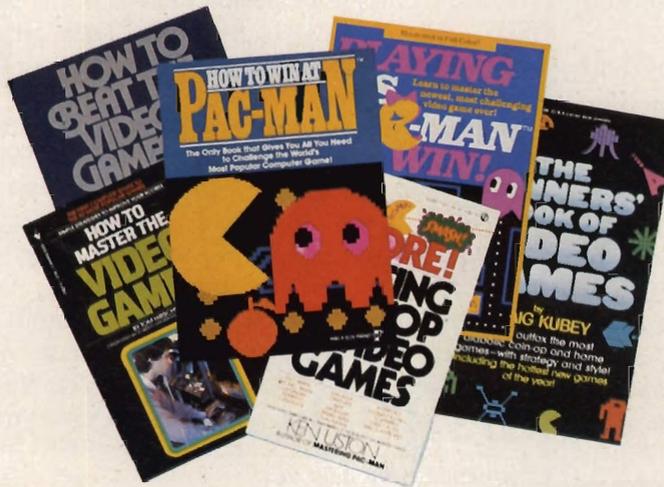

1. Lots of people are spending an awful lot of money on video games.
2. The machines are beating most of the people all of the time.
3. The players would like to play more and spend less.
4. Nobody cares about Rubik's Cube anymore.
5. Everybody who knows anything about cats has already done a book.
6. Somebody else has Garfield.
7. Let's do a how-to-beat video games book for all those frustrated gamers out there. They'll learn how to play longer and better their scores while we sell a ton of books.

And, lo and behold, after more than a few sleepless

nights, the spring has brought forth a veritable harvest of video books. Every publisher's got one, . . . some even have three or four.

The first book to hit the streets was Tom Hirschfeld's **How to Master the Video Games** (Bantam/\$2.95); getting out there first counted

Hirschfeld seems to have done his homework well. His observations and strategies for thirty games are fairly comprehensive and easy to follow (1a, b, c; 2a, b . . .). You'll find everything from Astro Fighter to Missile Command, but not a Tempest, Qix, or Stargate. In

for a lot. It's been on all the bestseller lists despite the fact that it reads just like the set of directions you usually find on the front of a game cabinet and most of the games are already outdated.

Hirschfeld has chosen to provide game information in a rigid, six-step format. He has a diagram of the screen, explains the scoring system, and the various ways you can lose. He follows with a number of observations about the game and a list of strategies.

video years, he's about a decade behind.

Hirschfeld's next offering, **How to Master Home Video Games** (Bantam/\$2.95) again was the first of its kind to make the racks. This time he only covers 16 games—five each of Atari's and Activision's and six for Intellivision. Again, Hirschfeld's advice is sound, but most of the games are on the way out.

Honestly, who needs a book that neglects such new carts as Atari's Defender and much-ballyhoed Pac-Man?

By Bob Mecoy

And what about the Odyssey² and Bally systems? Don't they rate a mention?

* * *

Ken Uston has made a career out of gaming. He started off as a stock broker, but found that he could have more fun making big bucks at the blackjack tables. Nowadays, he's banned from most of the country's casinos. Considering the fact that his **Mastering Pac-Man** is sitting on the bestseller list and **Score! Beating the Top 16 Video Games** (Signet/\$2.50) will probably be up there soon, he may not mind. **Score!** works. Uston has managed to get most of the latest games—Tempest, Donkey Kong, Ms. Pac-Man, Stargate, Qix and Frogger—and he writes about them with all the attention to detail that you'd expect from an obsessive. His coverage of Ms. Pac-Man and Donkey Kong is particularly strong with diagrams of every board and complete instructions for vanquishing your multi-colored foes.

Uston's methodology is excessively sane—watch, think, play, think, then play again. This is one book that really could improve your scores, but beware—Uston will have you making notes, drawing graphs and charting

(Continued on page 80)

PAC-JUMP

(Continued from page 26)

do with it. For us, that's quite an accomplishment."

But is it a case of America asserting itself or of Japan rethinking its own priorities? It seems to be a little of both. In Japan, the latest trend is toward versions of less action-oriented, board-type games such as Go, Othello, Mah Jong, and Golf. Shooting and chasing, still popular as ever here, have been replaced by quiet deliberation. None of these games has yet caught on in the States; they probably never will. Take Golf, for example: Unlike in the United States, golf is a very expensive and relatively elitist pastime in Japan. Despite this, the Japanese are fervent followers of the sport. "Golf is on television every night," says Yoko Yama. "People are constantly reading magazines about it. They want to play but they can't afford to. Basically, the reason for this is our limited land space. With the video game, they can now play anytime they wish.

"We like intricate games like golf," Yama further explains. "It helps us to get rid of psychological frustrations. Anglo-Saxons also seek to rid themselves of frustrations, but with more activity. For us, these games are a kind of clean-up."

I don't really understand Yama's distinction, so I asked Nokajima to possibly clarify for me. "It's hard to explain the difference between Japanese and American people," he says, "I think we go more hot and cold very quickly, like aluminum. Americans — you get hot and stay hot for awhile."

*I've got Pac-Man fever,
I'm going out of my mind.*

—Buckner & Garcia

The scene is the Broadway Arcade. If you weren't familiar with all the sights and sounds you'd think a police raid was going on. Pac-Man has been on the streets for over a year (four months would be an ample lifetime for any other machine, thank-you), and still there are people standing in line for the two machines. One unit is in the hands of a Pac-master; at 300,000,

he shows no signs of weariness and can talk fluently without disturbing his concentration. Watching him, I learn that this machine's program has been tampered with (which is usually the case after a game has been "maxed" by too many); it's taken him several quarters to discover that the first pattern differs from the second, the second through the fifth are the same, and the rest... well, he's working on that.

As I busily jot down all of this Pac-talk, there seems to be trouble brewing at the other machine. Two girls have been waiting behind this businessman-type for, they claim, the last 15 minutes. The man won't give it up. After each game (since he's a novice, they're short), he quickly dips into his pocket and deposits another coin in the slot. The girls are starting to get piqued.

"Hey mister, how 'bout letting somebody else have a chance?" one asks.

"Yeah, c'mon, man," the other cries. "Enough is enough already."

Mr. Wing-tip Shoes turns around and waves his finger in the girls' faces. "I waited for this machine and so can you."

"But it's been 15 minutes, man," one replies.

"We only want to play one game, anyway," the other says.

"And how am I supposed to know how good you are? How do I know you're not as good as *him*? No way."

His face plum red, he turns and pumps another quarter into Pac-Man. Such problems. Puck, puck, puck. □

BUSHNELL

(Continued from page 20)

play video games but found no acceptable environment for them to do it—particularly as a family. Kids love the games, but I didn't like the idea of them having to hang out in pool halls or junkie arcades in order to enjoy them. I think one of the real values of video games is that they allow parents to compete with their children. I wanted a family place where parents were encouraged to do that.

VG: Do you believe there is something essentially wrong with the arcades as we know them today?

BUSHNELL: Only in this sense: Arcades seem to be the domain of the teen-

ager and I don't think it's necessarily good for eight-year-olds to be bumping elbows with a whole bunch of guys who are in their teens. Don't misunderstand—I have nothing against teenagers. I just thought there should be an environment more compatible for the younger child.

VG: As I'm sure you're aware, arcades are under attack nationwide. How do you react to all of this?

BUSHNELL: I believe it's another case of what I call "anti-technology" forces at work—the nothings having their say. Whether it's nuclear power or whatever, they're really afraid of technology. Also, people have an ingrained notion about leisure—essentially, anything that's fun is somehow not holy.

What they don't see is that video games are really the training wheels for computer literacy. They almost feel that it's magic that kids can operate computers and they can't. An awful lot of the basic skills that are necessary for computer literacy are learned on video games. For example, I don't see a significant difference between moving a race car on a TV screen and moving a cursor. These skills are not only allowing kids to become computer literate, but computer skillful. But, no matter what happens, you're going to always have do-gooders who don't understand what the hell's going on attempting through legislation to prohibit something that they perceive as a danger—without really understanding what's going on.

VG: What could be done to make video games more acceptable to parents?

BUSHNELL: I think the manufacturers have not been doing as good a job as they could in making the games more educational. They are educational now, but there's so much more that could be done, that should be done.

There are ways that you can teach problem-solving as part of the game-playing activity. Right now, there's a little too much emphasis on eye-hand coordination and not enough on algorithm solution. That's kind of a mouthful and it means something to me, but it would be difficult to explain.

VG: I'm sure parents would be glad to hear that something was being accomplished other than shooting down goblins from space.

BUSHNELL: I wouldn't discount that

as irrelevant, however. I think if parents put a stopwatch on their kids, they'd find they spend an awful lot more time watching TV as a passive involvement than they do on video games, which is an active involvement. I will guarantee you that active is better than passive in almost every case.

VG: Although almost everyone in the high technology and venture capital fields grants that you are a great entrepreneur, you do take some flak on the subject of management style. Your critics point to things like Grass Valley—the think tank you had at Atari, which obviously didn't get its name from the kind of grass that grows on lawns. Does this talk irritate you?

BUSHNELL: Not really. I happen to think that you can't manage extremely creative people in the traditional ways. Pizza Time has a think tank, also; that's just my belief about how a company should work. The essence of manufacturing is to tap the creative lifeblood of the engineers and give them an opportunity to express themselves. In applied engineering, the far-out things always take a blackseat. Yet, if you don't do the seedwork you end up with a very lackluster and uninteresting company.

So, I think it's necessary to take people—even if there are only three or four of them—and get them away from the factory as far as possible... and just let them look into the future to two or three years down the road. Those ideas will form the base of tomorrow's technology.

VG: It's hardly a secret, however, that it was this kind of unorthodox approach to management that led to your falling out and eventual departure from Atari after Warner bought it.

BUSHNELL: Well, that's debatable. The fact remains every single one of Atari's major innovations originated in Grass Valley: the basic architecture of the Video Computer System, the XY-monitor, the high-speed microprocessor game drive, the 800 computer all came out of Grass Valley.

I just think there's no direct correlation between hard work and good results. You need leisure for perspective and work for execution. But all execution and no perspective leads to a bad product.

VG: Is it true that Steve Jobs came to you when he was working at Atari and

told you about a "personal" computer that he and Steve Wozniak were building in a garage and you weren't interested in it from a business point of view? It's only interesting now, of course, since their company turned out to be Apple Computer.

BUSHNELL: I thought it was a good idea, but I was trying to get Pizza Time off the ground at the time and my legal situation with Warners was tangled on the matter of competition with them. I did, however, put Steve in touch with some venture capital sources.

VG: Let's move along to the latest venture you're involved in, the Catalyst Group. What is it about?

BUSHNELL: Well, as you know, this is a very active area for entrepreneurs. They're always looking for venture capital sources for financing, but before they get to that stage there are often millions of decisions to be made, such as what kind of telephone system to install, which xerox to buy, whether to have an auditor, an attorney, what kind of accounting system to set up, whether you should incorporate as a subchapter corporation, where to go for venture capital. All of these things are basically of an administrative nature. The Catalyst Group—which now has seven companies under its umbrella—takes care of these functions for the entrepreneur so he can focus on his technology and marketing capabilities.

Essentially, it's a kind of pre-venture capital nursery for entrepreneurs. I'm attempting to help start-ups to not make the same mistakes I did. It's not altruism entirely, of course. If the entrepreneur's idea really takes off, the Catalyst Group owns part of the company.

VG: By the time the Catalyst Group gets its share and the venture capitalists get theirs, is there anything left for the entrepreneur?

BUSHNELL: Sure. Twenty-five or 30 percent of something is better than a hundred percent of nothing.

VG: One final question. How do you view yourself—as a technological pioneer or an entrepreneur?

BUSHNELL: Oh, I'm an entrepreneur. When I see a concept that makes sense, I have to put it in action. I guess I'm a person who's driven by the dream of converting fantasy into reality. The minute I believe in something I have to take steps to turn it into a reality. □

DOCTOR VIDEO

(Continued from page 68)

playing videogames, but are we to penalize the great majority because of the excesses of a small minority? Let's hope not.

The solution may be found when more adults sneak into the arcades to play Pac-Man or Space Invaders and find that it is not the mere playing of a videogame that is destructive; rather, it is time *not* spent doing other things, such as listening to music, studying, socializing or relating to family member, that can be harmful.

In conclusion, I would like to reaffirm my belief that videogames can and will continue to be useful adjuncts to rehabilitation. Their use with non-impaired populations will hopefully result in an increased awareness and acceptance of the role of microcomputers in all of our lives.

COMING ATTRACTIONS

Video games go to the movies—we'll feature Tron and explore the latest in made-for-TV movie games.

Do video games cause tunnel vision? Dr. Video sees all.

Coleco goes "head-to-head" with Atari and Mattel—what is a confused consumer to do? Read HARD SELL, of course.

ACTIVISION

(Continued from page 31)

two or three months.”

For example, in Larry Kaplan's *Kaboom!*, the mad bomber wears a devilish grin as he tosses hundreds of explosives down the screen—that is, until you reach the 10,000 point mark (3,000 would be enough to satisfy most gamers). Then, the bomber suddenly frowns and continues to mope until he finally finishes you off. That's what Dave Crane calls “embellishments.”

“We like to do things like that as much as possible,” he grins devilishly. “I'm talking about the little things—rotating tires, screeching brakes and other features you might not see in somebody else's games. That's a general concept here. I mean, who cares if a spaceship looks like a flying donut or something? Who knows what a spaceship looks like anyway?”

Jim Levy may sound like a braggart when he crows, “Activision has gone beyond the acceptable to the unexpected.” □

BOOKBEAT

(Continued from page 77)

like a full-bore game zombie, which *Score!* clearly proves he is.

* * *

Simon and Schuster is the publisher with a whole array of video books. From their subsidiary Pocket Books and the editors of *Consumer Guide* comes **How to Win at Pac-Man** (Pocket/\$2.50), a four-color pamphlet that wins the good-looks award hands down and does have the most complete and comprehensible set of Pac-patterns around. If that's all you want, then this is the book for you. S & S followed that up with **Playing Ms. Pac-Man to Win!** (Wallaby/ \$2.50). Here again, you get a good-looking four-color pamphlet that has all the mazes you'll probably reach and a pattern for each one of them. This book comes by way of a new group, Video Game Books, Inc.; *How to Win at Donkey Kong* will be their next offering.

Finally, from S & S we have Michael Blancet's **How to Beat the Video**

Games (Fireside/\$3.95). The author's own story is almost as interesting as the book; it reads like *A Star is Born*. Vid whiz is discovered maxing Battle Zone by a *New York Times* reporter; two months later, he's the focus of an in-depth article about the games phenomenon. In comes the book offer. He takes it. Story ends there.

How to is a passable how to. It covers 20 games, including a few of the latest—his tips should be of value to experts as well as the lowest-ranking novice. It's a mediocre-looking book (no color) that can actually be read if you have the time or inclination. No outlines here. Blancet's writing style is very conversational; he gives good game.

* * *

The wild and craziest entry in this sweepstakes is Craig Kubey's **Winners' Book of Video Games** (Warner/\$5.95). If you've ever had a friend try to explain how he was beating a game while doing it—you know, shouting over the booms and whistles at an arcade—you get the general idea of how this book reads.

Kubey hammers his way through coin-op and home video (he's infinitely better in the arcades) with the grace of Donkey Kong's mighty Mario the Carpenter. His approach—trying to give you a *feel* for the game—is fun, but runs dry about halfway through this exhausting, 288-page opus. It has good tips (especially in the interview with Tempest's designer Dave Theurer), lousy graphics and energy to burn. Unfortunately, Kubey is no Hunter Thompson, who is one of two famous persons he dedicates the book to.

* * *

These are only six of the approximately 20 titles that will soon be available in your local bookstore. Reading them can make a difference in your scores and also give you something to do while you're waiting around the house for the arcade next door to open . . . or get shut down. □

Call Them AT&Tari

Atari has bought every company in America and changed its name to AT&Tari, reports the *Off The Wall Street Journal*.

PLAY BALL!

(Continued from page 58)

leave it out?

The Apple II comes enclosed in a compact, lightweight case with a typewriter-style 52-key keyboard. Although letters are displayed in uppercase only, a number of devices can modify the system to allow it to show lower-case as well. The basic unit includes 16K RAM, but 32K or 48K is also available. Owners of a 16K machine can expand their system in 16K steps simply by inserting RAM chips into existing sockets. An interface for a cassette recorder, a built-in speaker for sound input and an output for black-and-white or color monitor (not TV set) is included. Eight expansion slots located under the case cover makes possible hooking up such devices as a printer, disk drive and modem for telecommunications. Joysticks and paddles are optional.

Unlike most companies, Apple provides detailed documentation about their computer. Encouraged by this, peripherals and software firms offer a wide line of products to mate with the Apple II.

* * *

Before you make your decision about which computer to buy, stop by your local computerama and play with the machines for awhile. When you find one you really like make sure you are comfortable with the feel of the keyboard, the display format and the keyboard layout. Take some time to *read*—not *browse*—through the instruction manual. Is it simple and clear enough for you to become “friendly” with the machine or does it seem menacing and difficult to struggle through? Then, finally, organize your intended applications on a piece of paper and chat with the computer salesman taking careful note of recommendations.

Don't be misled by the basic price. If you plan to use the machine for more than game-playing, you'll need more and more accessories, which will raise the overall system cost dramatically. Well, that's the bad news. The good news is that your investment may not only provide hours of entertainment, but may help you and others who use it in your careers and ventures.

Happy hunting! □
